## GSMA proposal on Lifecycle Management

13<sup>th</sup> November 2014

- Background
- Summary of the concerns on the eCall Lifecycle Management
- GSMA position on Lifecycle Management
- Q&A

- For the EeLP meeting held in May 2014, GSMA sent a Liaison Statement about lifecycle management (CLMA 006 LS). The Liaison Statement raised some questions regarding the lifecycle management.
- During 2014 GSMA continued the discussion about eCall within a dedicated task force that involves Mobile Operators and also Automakers.
- As result of discussion with operator members GSMA has revisited the concerns raised in LS and collected an harmonised proposal from MNOs members.

- **ITEM 1: Certification, Periodic Testing and End to End Conformance Testing for eCall**
  - Which tests, with what objectives
  - Role of different players
- **ITEM 2: Change of Ownership through Private Sales**
  - How would an eventual reconfiguration test call be handled for cancelled eCall+ services?  
Are other new processes necessary?
  - How to manage eventual change of home country (test numbers, subscription package)?
- **ITEM 3: User service subscription change (and implications for consent management)**
  - How to reconfigure eCall only services to eCall+/TPS?
- **ITEM 4: Operator Changes**
  - Implications for eUICC and reconfiguration
- **ITEM 5: End of Life**
  - How to ensure that eCall is supported for the individual vehicle life versus average vehicle life?
  - How to understand that SIM is no longer in circulating vehicle?
- **ITEM 6 Interoperability Concerns on between eCall - ERA GLONASS during the vehicle life time**

- **PROPOSAL:** Suggest a fixed duration of a commercial contract between OEMs and MNOs, for example 10 yrs (predefined lifetime).
- ✓ **Certification:** the proposal is to follow the same certification in place for mobile devices (there are already specification available)

**NOTE:** eCalls would still be possible after this time, since this would be treated as 'limited service state' i.e. there is a deactivated SIM, thus there would be no CLI and no call-back support. This assumes that national administration allows emergency calls in limited service state.
