Other Information
1 Introduction

This document holds ANNEX F to the GSMA HD Voice Logo Licence Agreement. The GSMA HD Voice Logo Licence Agreement and further relevant information and contact details can be found on http://www.gsma.com/hd-voice.

Annex F: Minimum Requirements for Mobile Networks and Terminals for the usage of the ‘HD Voice’ logo with LTE

This Annex defines the minimum requirements for the usage of the ‘HD Voice’ logo for LTE network operators and device vendors.

Terms:

HD Voice (High Definition Voice) for mobile terminals and networks comprises of AMR-WB codec and the enhancements to terminals and networks according to the requirements defined in this document.

AMR-WB is the Codec defined in 3GPP TS 26.171.

Further information and technical details of AMR-WB are described in GSMA PRD IR36 "Adaptive Multirate Wide Band".

This Annex is split into two sections:

1. ANNEX F1: Minimum Requirements to be fulfilled by mobile network operators in order to use the ‘HD voice’ logo for the marketing of the AMR-WB functionality in LTE networks.
2. ANNEX F2: Minimum Requirements to be fulfilled by mobile device vendors in order to use the ‘HD voice’ logo for the devices supporting AMR-WB in LTE mode.

Annex F1: Minimum Network Requirements for HD Voice with LTE

F1.0 HD voice enabled LTE mobile networks

To support HD Voice in the LTE network, the operator shall support AMR-WB in the LTE network as described in the rest of Annex N3. AMR-WB is the codec defined in 3GPP TS 26.171 (Speech codec speech processing functions: Adaptive Multi-Rate – Wideband (AMR-WB) speech codec; General description) and other related specifications.

The HD voice service on the LTE network shall be compliant with 3GPP specifications for voice over IP Multimedia Subsystem (IMS) as specified in TS 26.114 (IP Multimedia Subsystem; Multimedia Telephony; Media handling and interaction) and all other related specifications. The HD voice service shall also be compliant with GSMA IR.92 (IMS Profile for Voice and SMS).

AMR-WB may also be supported in the GSM and/or UMTS network; however, this is not a mandatory requirement.
F1.1 AMR-WB codec rates
At a minimum the AMR-WB codec set 0 [6.6, 8.85, 12.65 kbps] shall be supported as described in IR.92 section 3.2.1.

If activated, mode rate adaptation for speech shall be as described in 3GPP TS 26.114 section 7.3 and section 7.5.2.1.2.

F1.2 Codec selection
When end-to-end AMR-WB is possible, it shall be selected with the highest priority by the LTE network. If AMR-WB is supported only in a part of the voice path, but wideband voice is feasible end-to-end by transcoding, then this configuration must be preferred over a narrowband voice configuration.

F1.3 TrFO (Transcoder-Free Operation)
AMR-WB should be transparently transmitted between both ends. TrFO must be used within an operator's LTE network. TrFO should also be used between operators networks according to the network architecture (IP interfaces and transport).

F1.3.1 Support of TrFO of 3rd party equipment
If there is 3rd party equipment in the end-to-end chain, e.g., a Voice Quality Enhancement system, this system must be transparent to TrFO signaling and preserve wideband voice.

F1.4 Transcoding
If transcoding is necessary between two systems providing a wideband voice codec (e.g. G.722 on one side and G.722.2 (AMR-WB) on the other side) then the transcoding shall keep the extended frequency range, i.e., no fallback to G.711 or another narrowband codec must happen within the transcoding processes.

If Transcoding is necessary the speech levels shall be aligned to ensure suitable audio levels to the end users. This alignment shall be performed such that the nominal level is preserved (0 dBm0 shall be maintained to 0 dBm0).

F1.5 Impact on KPI values
The introduction of AMR-WB in the LTE network shall have no negative impact on any user related KPI values, i.e., Call Setup Success Rate, HO failure rate, Call drop rate, etc. shall be at least as good as before the activation of AMR-WB.

F1.6 Use Cases for HD Voice

F1.6.1 Setup of a voice call between two AMR-WB enabled devices
AMR-WB call setup shall be performed
- If both devices are AMR-WB enabled
- If both devices are in an AMR-WB enabled area
- If the HLR-HSS entry does allow the user to use AMR-WB (note that an HLR-HSS entry is optional)
• If radio and other resources allow HD Voice end to end

F1.6.2 Setup of a voice call between two HD Voice devices, one being in AMR-WB enabled area, the other one not
This scenario does not allow HD Voice communication between the devices.

The used end to end codec shall be selected by the network(s) in an automatic way, i.e., without user interaction.

F1.6.3 Setup of a voice call between a HD Voice and a non HD Voice device
This scenario does not allow HD Voice communication between the devices.

The used codec shall be selected by the network in an automatic way, i.e. without user interaction.

F1.6.4 Hand Over within AMR-WB coverage
Mobility within AMR-WB coverage shall be supported without higher call drop rates as compared to AMR-NB and with minimal audio defects (for example, extended interruption times, audio distortion or added noise) as compared to AMR-NB.

This holds for mobility inside the same LTE network or to other access networks enabled with AMR-WB. In the case of mobility inside the same LTE network, the MOS score and the e2e delay after the handover shall remain identical to the original ones and the handover coverage shall include at least:

• Intra and Inter eNB (Evolved Node B) mobility
• Intra and Inter MME (Mobility Management Entity) mobility
• Intra and Inter S-GW (Serving Gateway) mobility

F1.6.5 Hand Over between AMR-WB enabled area and non AMR-WB enabled area
A Hand Over of a HD Voice device during an ongoing WB call to the non AMR-WB enabled area shall be possible without call drop and user interaction. Since AMR-WB can no longer be supported after the Hand Over, the next higher voice codec (i.e. the voice codec providing the highest possible call quality) shall be selected in an automatic way.

F1.7 Access to Services
The access of HD Voice device to supplementary services like Announcements, “Personal Ring-back Tones”, Voice Mail, Multi Party calls, and so on shall be guaranteed at least in narrow band quality.

HD Voice should be supported onto these supplementary services. In such a case audio prompts shall be stored and reproduced in wide band quality.
Annex F2: Minimum Requirements for LTE Mobile HD Voice Devices

A mobile HD Voice device is characterised by:

- Supporting the AMR-WB codec and the associated media control and media transport,
- Providing improved wide band and narrow band speech quality acoustical characteristics and speech processing,
- Supporting the mechanisms (jitter buffer management, packet loss concealment …) that minimize the effects induced by the transport channel,
- Ensuring the preservation of voice quality in case of handover or of concurrent data applications.

The requirements for a mobile terminal carrying the GSMA HD Voice Logo are translated into technical requirements described in the rest of Annex F2.

These requirements are based on the GSMA IR.92 specification, which itself refers to 3GPP Technical Specifications TS 26.114, TS 26.131 and TS 26.132 for the required measurement methods. Release 12.0 of 3GPP Technical Specifications are referred to in the requirement descriptions below. It is anticipated that in the future they will be replaced by further TS releases provided these do not yield any quality regression.

In all cases where the requirements allow flexibility for positioning the terminal, the position used for the tuning and for the measurement shall be reported. This is valid for all modes (handset, handheld hands-free and headset).

F2.1 AMR-WB support

As described in IR92 clause 3.2.1 the mobile HD Voice device shall support the AMR-WB codec as defined in 3GPP Technical Specifications 3GPP TS 26.171, 3GPP TS 26.190, including all nine (9) modes, associated essential mechanisms, such as discontinuous transmission (DTX) as described in 3GPP TS 26.193 and error concealment procedure as described in 3GPP TS 26.191. The mobile HD Voice device shall be able of operating with any subset of these nine (9) codec modes.

AMR-WB codec must be listed as the first payload type in the SDP offer.

F2.2 Media control and media transport

As described in GSMA IR.92, clause 3.2.2:

The Real Time Protocol (RTP) profile, Audio Video Profile (AVP) IETF RFC 3551 shall be used.

The SDPCapNeg framework shall not be used, but the VoLTE device shall be able to receive and answer to an SDP offer which uses SDPCapNeg. The answer shall indicate the use of the RTP AVP profile. ECN as described in 3GPP TS 26.114 is not requested.

The HD Voice device must use RTP over UDP as described in IETF RFC 3550 and IETF RFC 768, respectively, to transport voice and use symmetric RTP as defined in IETF RFC 4961 (see GSMA IR.92 clause 3.2.3).

In accordance in GSMA IR.92, clause 3.2.5;
The AMR-WB and the AMR payload formats as specified in IETF RFC 4867 must be used. The two modes “bandwidth-efficient” and “octet-aligned” must be supported.

When originating a session, the HD Voice device must request the use of bandwidth-efficient mode.

The HD Voice device must send the number of speech frames, or fewer, encapsulated in each RTP packet as requested by the other end using the ptime attribute.

The HD Voice device must request to receive one speech frame encapsulated in each RTP packet but must accept any number of frames per RTP packet, up to the maximum limit of 12 speech frames per RTP packet. Consequently, in the SDP negotiation, the ptime attribute must be set to 20 and the maxptime attribute must be set to 240.

The HD Voice device must be able to sort out the received frames based on the RTP Timestamp and must remove duplicated frames if present.

The HD Voice device must support RTCP as described in GSMA IR.92 clause 3.2.4.

**F2.3 Wide Band Audio chain**

The entire audio chain within the mobile HD Voice device must be wide band compliant. When the call is established with AMR-WB as selected codec, then the complete audio chain of the mobile HD Voice device must operate at 16 kHz sampling rate, or higher.

**F2.4 Handset Mode – Frequency Response**

**F2.4.1 Handset Mode – Frequency Response Sending Side**

In handset mode, the HD Voice device frequency response for sending shall be compliant with the mask described in 3GPP TS 26.131 clause 6.4.1 for wide band calls and to the one described in 3GPP TS 26.131 clause 5.4.1 for narrow band calls.

**F2.4.2 Handset Mode – Frequency Response Receiving Side**

In handset mode, the HD Voice device frequency response for receiving shall be compliant with the mask described in 3GPP TS 26.131 clause 6.4.2 for wide band calls and to the one described in 3GPP TS 26.131 clause 5.4.2 for narrow band calls.

**F2.5 Handset Mode - Loudness**

In handset mode, for narrow band calls, loudness rating for sending (SLR) and receiving (RLR) shall be compliant with 3GPP TS 26.131 clause 5.2.2. For wide band calls, loudness rating for sending (SLR) and receiving (RLR) side shall be compliant with 3GPP TS 26.131 clause 6.2.2.

To avoid strong level variations in case of handover from AMR-WB enabled area to a non-AMR-WB-enabled one or back, all values for narrow band and wide band cases should be as close as possible for the same volume control setting. Their difference should not exceed 3 dB.

When the control is set to its maximum, the RLR value (RLR_MAX) shall not be lower than or equal to -13 dB and shall not be higher than or equal to -3 dB.
F2.5 Handset Mode - Echo Loss
In handset mode, for narrow band calls, the echo loss shall be compliant with 3GPP TS 26.131 clause 5.7.4.
In handset mode, for wide band calls, the echo loss shall be compliant with 3GPP TS 26.131 clause 6.7.4.

F2.6 Handset Mode - Distortion
In handset mode, for narrow band calls, the distortion levels for sending and for receiving shall be compliant respectively with 3GPP TS 26.131 clause 5.8.1 and clause 5.8.2.
In handset mode, for wide band calls, the distortion levels for sending and for receiving shall be compliant respectively with 3GPP TS 26.131 clause 6.8.1 and clause 6.8.2.

F2.7 Handset Mode - Idle Noise
In handset mode, for narrow band calls, the idle noise for sending and for receiving shall be compliant respectively with 3GPP TS 26.131 clause 5.3.1 and clause 5.3.2.
In handset mode, for wide band calls, the idle noise for sending and for receiving shall be compliant respectively with 3GPP TS 26.131 clause 6.3.1 and clause 6.3.2.

F2.8 Handheld hands-free mode - Acoustical Performance
In handheld hands-free mode, the HD Voice device frequency response, loudness and echo loss shall comply with 3GPP specification.
For narrow band calls:
- The nominal loudness ratings shall be compliant with 3GPP TS 26.131 clause 5.2.4.
- The frequency response shall be compliant with 3GPP TS 26.131 clause 5.4.5 for sending and clause 5.4.6 for receiving.
- The echo loss shall be compliant with 3GPP TS 26.131 clause 5.7.3.
For wide band calls:
- The nominal loudness ratings shall be compliant with 3GPP TS 26.131 clause 6.2.4.
- The frequency response shall be compliant with 3GPP TS 26.131 clause 6.4.5 for sending and clause 6.4.6 for receiving.
- The echo loss shall be compliant with 3GPP TS 26.131 clause 6.7.3.

F2.9 Wired Headset mode - Acoustical Performance
In wired headset mode, the HD Voice device shall be compliant with 3GPP headset related specifications.
For narrow band calls:
- The loudness ratings shall be compliant with 3GPP TS 26.131 clause 5.2.5.
- The frequency response shall be compliant with 3GPP TS 26.131 clause 5.4.1 for sending and clause 5.4.2 for receiving.
- The idle noise for sending and for receiving shall be compliant respectively to 3GPP TS 26.131 clause 5.3.1 and clause 5.3.2.
For wide band calls:
- The loudness ratings shall be compliant with 3GPP TS 26.131 clause 6.2.5.
The frequency response shall be compliant with 3GPP TS 26.131 clause 6.4.1 for sending and clause 6.4.2 for receiving.

The idle noise for sending and for receiving shall be compliant respectively to 3GPP TS 26.131 clause 6.3.1 and clause 6.3.2.

The headset shall be tested with identified HD Voice devices. The list of HD Voice devices a headset is compliant with will be made available.

F2.10 - Noise Reduction – General Requirement

For sending, in handset mode, the HD Voice device shall reduce the ambient noise picked up by the microphone without degrading the quality of the speech signal.

The noise reduction performance shall be measured in wide band mode. It shall be tested through the objective method as described in section F2.10.1. In case of doubt on the results of the objective method, the subjective methodology, as described in section F2.10.2 can be used.

F2.10.1 - Noise Reduction - Objective evaluation

In handset mode, for wide band calls, the S-MOS-LQO and N-MOS-LQO scores shall be compliant with 3GPP TS 26.131 clause 6.10.2 performance objective. Namely:

- The average of the S-MOS-LQOw scores across all test conditions shall be ≥ 3.5.
- The average of the N-MOS-LQOw scores across all test conditions shall be ≥ 3.0.
- Individual scores as well as the average across all test conditions shall be reported.

F2.10.2 - Noise Reduction – Subjective evaluation

The subjective evaluation may be applied as an optional procedure, only in cases where there is evidence that the objective method significantly underestimates one of the scores. In such cases the subjective result will supersede the objective result for each of the individual and averaged scores.

The objective measurement results should be made available with any subjective results. Note: The results of the objective method and the subjective method generally are not directly comparable. Due to the limited types of impairments covered in the subjective test and the variability which might be seen in different test labs, for different languages and also in different cultures, different scores may be obtained.

Test method

The subjective test method is according to ITU-T P.835 and the ITU-T Handbook of subjective testing practical procedures, with the following observations:

- The speech material (near end signal) shall consist of 32 sentences of speech (2 male and 2 female talkers, 8 sentences each). The speech database shall conform to the guidelines specified in ITU-T handbook of subjective testing practical procedures, section 5, and section B.3 of ITU-T P.501. Each sentence shall be normalized to an active speech level of -26dBoV.

The background noise shall be setup and equalized according to ETSI EG 202 396-1. Noise types shall be reproduced at their realistic levels according to EG 202 396-1 clause 8. The test conditions are specified in Table CF.

Table F2: Test and Reference conditions for subjective evaluation of Noise Reduction
The handset terminal shall be set up on HATS and the handset mounting position documented as described in 3GPP TS 26.132 clause 6.1.1.

For reproduction of the near-end signal, a HATS conforming to ITU-T P.58 is used. The mouth simulator shall be equalized according to 3GPP TS 26.132 guidelines and the gain adjusted to produce an active speech level of -1.7 dBPa at the MRP.

The send signal is recorded at the electrical reference point of a network simulator to generate the processed (noise suppressed) speech materials for the subjective test. The network simulator shall be set to an UMTS call with AMR-WB 12.65kbps speech codec.

The recordings of processed speech materials and reference conditions shall be normalized for use in the subjective test.

For the test conditions, the normalization gain is the gain necessary to obtain an active speech level of -26 dBov with a clean speech condition (no noise applied in the room). This normalization gain shall then be applied to all other test conditions (noise suppressed speech signals).

For the reference conditions, the clean speech and noise signals shall be filtered with the MSIN and LP7 filters available from ITU-T G.191. LP7 filter will be used in combination with the HQ3 up-sampling (1:3) and down-sampling (3:1) as defined in G.191 as well. Prior to mixing, the speech shall be normalized to an active speech level of -26 dBov. The mixing shall be performed to obtain the SNRs described in Table C2. The SNR is defined as the ratio between active speech levels to unweighted noise level.

The headphones used are calibrated and equalized using a HATS conforming to ITU-T Recommendation P.58 and an artificial ear type 3.3 according to ITU-T Recommendation P.57. The HATS is diffuse field equalized. The resulting frequency response characteristic of the headphones used in the subjective experiments shall be within the mask given in TS 26.131, clause 6.4.2.

The presentation of the test and reference conditions to listeners shall be diotic, and the system gain adjusted so that a speech segment of -26 dBov corresponds to a presentation level of 73 dB SPL measured at the DRP with diffuse-field equalization of the HATS active.

The experimental design shall include the 12 reference and 8 test conditions described in Table F2.

The test and reference conditions shall be presented to a total of 32 naive listeners. The listeners shall be native speakers of the language used for the test. The subjective test presentation sequence (i.e. “randomizations”) is provided in Table F3. Each of the eight presentation sequences in Table F3 shall be presented to four of the 32 listeners.
Requirements

When testing through the subjective methodology, the HD Voice device shall comply with the following requirements:

- **P.835 SIGw**: Transmission quality of the speech
  - The average of P.835 SIGw scores across all 8 different ambient noise conditions from Table F2 shall be: ≥ 3,5

- **P.835 BAKw**: Transmission quality of the background noise
  - The average of P.835 BAKw scores across all 8 different ambient noise conditions from Table F2 shall be ≥ 3,0
Figure F2.10-1: Processing for generating the reference conditions of the subjective test.

F2.11 - Speech path delay of mobile HD Voice devices
F2.11.1 UE delay in jitter and error free conditions
In handset and wired headset mode, for narrow band calls, the UE delay in jitter and error free conditions shall be measured according to the method described in 3GPP TS 26.132 v12.1.0 clause 7.10. Results shall be reported.

In handset and wired headset mode, for wide band calls, the UE delay in jitter and error free conditions shall be measured according to the method described in 3GPP TS 26.132 v12.1.0 clause 8.10. Results shall be reported.

Requirements are under study by 3GPP TSG SA WG4 and will be added to this specification upon completion of the work item by 3GPP.

F2.11.2 UE delay and speech quality in jitter and error conditions
Test method and requirements in this section are under study by 3GPP TSG SA WG4. This section will be updated upon completion of the work item by 3GPP.

F2.12 Sidetone characteristics
In handset and wired headset mode, for narrow band calls, the sidetone characteristics shall be compliant with 3GPP TS 26.131 clause 5.5. The maximum sidetone delay shall be ≤ 5 ms.

In handset and wired headset mode, for wide band calls, the sidetone characteristics shall be compliant with 3GPP TS 26.131 clause 6.5.

F2.13 Template for reporting test results
Acoustic performance test results and handset positioning information for the UE may be reported using the template attached (GSMA_HDVoice_Acoustic_Performance_Template_v2_0_AnnexF.xlsx)

Table F5: HD Acoustic Performance
