1 Introduction

1.1 Overview

The IP Multimedia Subsystem (IMS) Profile for Voice and Video, documented in this Permanent Reference Document (PRD), defines a profile that identifies a minimum mandatory set of features which are defined in 3GPP specifications that a wireless device (the User Equipment (UE)) and network are required to implement in order to guarantee interoperable, high quality IMS-based telephony and conversational video services over Wi-Fi access.

"Wi-Fi" is a trademark of the Wi-Fi Alliance and the brand name for products using WFA programs based on the IEEE 802.11 family of standards.

In this document, Wi-Fi access refers to a WLAN access to EPC, either trusted (S2a interface) or untrusted (S2b interface), as defined in 3GPP TS 23.402 [6].

The scope includes the following aspects:

- IMS basic capabilities and supplementary services for telephony [Chapter 2]
- Real-time media negotiation, transport, and codecs [Chapter 3]
- Wi-Fi radio and (evolved) packet core capabilities [Chapter 4]
- Functionality that is relevant across the protocol stack and subsystems [Chapter 5].

The conversational video services comprise calls with full duplex voice and simplex/full-duplex video media with tight synchronization between the constituent streams. The call can be a point to point call or a multiparty conference call. The conversational video service can also be used to interact with for example dial in video conference systems.

A UE and a network compliant to this profile must support IMS-based telephony. A UE and a network compliant to this profile may support conversational video services.

1.2 Relationship to existing standards

1.2.1 3GPP Specifications

This profile is based on the open and published 3GPP specifications as listed in Section 1.5. 3GPP Release 11 is taken as a basis. It should be noted, however that not all the features specified in 3GPP Release 11 are required for compliance with this profile.

Conversely, some features required for compliance with this profile are based on functionality defined in 3GPP releases higher than the release taken as basis.

All such exceptions are explicitly mentioned in the following sections along with the relevant 3GPP Release.

Unless otherwise stated, the latest version of the referenced specifications for the relevant 3GPP release applies.
1.3 Scope

This document defines a voice and video over Wi-Fi IMS profile by profiling a number of Wi-Fi, (Evolved) Packet Core, IMS core, and UE features which are considered essential to launch interoperable IMS based voice and video on Wi-Fi. This document is based on the IMS Voice and SMS profile described in PRD IR.92 [1] and on the IMS Profile for Conversational Video Service profile described in PRD IR.94 [2]. The defined profile is compliant with 3GPP specifications. The scope of this version of the profile is the interface between UE and network.

The profile does not limit anyone, by any means, to deploy other standardized features or optional features, in addition to the defined profile.

2 IMS feature set

2.1 General
The IMS profile part lists the mandatory capabilities, which are required over the Gm and Ut reference points.

2.2 Support of generic IMS functions

2.2.1 SIP Registration Procedures
The UE and the network must fulfil the requirements on IMS feature set specified in section 2.2.1 of GSMA PRD IR.92 [1], with the exception that section L.3.1.2 of 3GPP TS 24.229 [5] is not applicable.

Note: PRD IR.92 [1] contains explicit statements when the UE must register with the IMS. Currently 3GPP specifications do not have similar statements.
regarding VoWi-Fi. It is for further study if explicit statements can be created for VoWi-Fi (in addition to what is specified in section 2.4.2.1).

A UE and a network supporting Conversational Video Service over Wi-Fi must fulfill the additional requirements on IMS feature set as specified in section 2.2.1 of GSMA PRD IR.94 [2].

The UE must support and use access-type in P-Access-Network-Info as specified in 3GPP TS 24.229 [5] section 7.2A.4.2. The P-Access-Network-Info header must contain one or more access-infos, one of them being the i-wlan-node-id parameter as specified in 3GPP TS 24.229 [5] section 7.2A.4.2. The i-wlan-node-id shall be set to the value of the MAC address of the WLAN Access Point.

If it is a Session Continuity UE (SC-UE), the UE must support and use the g.3gpp.accesstype media feature tag as specified in section 6.2.2 of 3GPP TS 24.237 [15].

If moving the PDN connection to the IMS well-known APN between Wi-Fi and cellular access as described in section 4.5 of this document, the UE must:

- initiate re-registration procedure as specified in 3GPP TS 24.229 [5], section 5.1.1.4 and 3GPP TS 23.228 [14] in section 5.2.2.4,
- update P-Access-Network-Info header field, and
- if it is a SC-UE, update the g.3gpp.accesstype media feature tag as specified in section 6.2.2 of 3GPP TS 24.237 [15].

### 2.2.2 Authentication

The UE and the network must fulfill the requirements on IMS feature set specified as specified in section 2.2.2 of GSMA PRD IR.92 [1].

### 2.2.3 Addressing

The UE and the network must fulfill the requirements on IMS feature set as specified in section 2.2.3 of GSMA PRD IR.92 [1].

### 2.2.4 Call Establishment and Termination

The UE and the network must fulfill the requirements on IMS feature set as specified in section 2.2.4 of GSMA PRD IR.92 [1].

A UE and a network supporting Conversational Video Service over Wi-Fi must fulfill the additional requirements on IMS feature set as specified in section 2.2.2 of GSMA PRD IR.94 [2].

### 2.2.5 Forking

The UE and the network must fulfill the requirements on IMS feature set as specified in section 2.2.5 of GSMA PRD IR.92 [1].

A UE and a network supporting Conversational Video Service over Wi-Fi must fulfill the additional requirements on IMS feature set as specified in section 2.2.3 of GSMA PRD IR.94 [2].
2.2.6 The use of Signalling Compression
The UE must not use SIGCOMP when the initial IMS registration is performed over Wi-Fi.

2.3 Supplementary Services
The UE and the network must fulfil the requirements on IMS feature set as specified in section 2.3 of GSMA PRD IR.92 [1].

A UE and a network supporting Conversational Video Service over Wi-Fi must fulfil the additional requirements on IMS feature set as specified in section 2.3 of GSMA PRD IR.94 [2].

2.4 Call Set-up Considerations

2.4.1 SIP Precondition Considerations
The UE and the network must fulfil the requirements on IMS feature set as specified in section 2.4.1 of GSMA PRD IR.92 [1].

Note: Even though resources are available, the UE uses preconditions and sets the local preconditions accordingly in SDP offer and answer.

2.4.2 Integration of resource management and SIP

2.4.2.1 Loss of Radio Connection
If the UE loses radio connectivity and the IMS registration has expired prior to regaining radio connectivity, then upon regaining radio connectivity the UE must perform a new initial registration to IMS.

2.4.3 Voice Media Considerations
The UE and the network must fulfil the requirements on IMS feature set as specified in section 2.4.3 of GSMA PRD IR.92 [1].

2.4.4 Video Media Considerations
A UE and a network supporting Conversational Video Service over Wi-Fi must fulfil the requirements on IMS feature set as specified in section 2.4.2 of GSMA PRD IR.94 [2].

2.5 SMS over IP
The UE and network must fulfil the requirements on IMS feature set as specified in section 2.5 of GSMA PRD IR.92 [1].

3 IMS media
The UE and the network must fulfil the requirements on IMS media as specified in section 3 of GSMA PRD IR.92 [1].

A UE and a network supporting Conversational Video Service over Wi-Fi must fulfil the additional requirements on IMS media as specified in section 2.3 of GSMA PRD IR.94 [2].
4 Radio and packet core feature set

4.1 Radio capabilities

4.1.1 Alignment with Wi-Fi Alliance Certification programmes
The UE must fulfil the requirements as specified in section 2 of GSMA PRD TS.22 [4].

4.1.2 WLAN Policy provisioning
The UE must fulfil the requirements as specified in section 3 of GSMA PRD TS.22 [4].

4.1.3 Connection management
The UE must fulfil the requirements as specified in section 4 of GSMA PRD TS.22 [4].

4.2 Trusted/Untrusted Wi-Fi IP Access Network Detection
During initial attach or handover attach a UE must discover the trust relationship per 3GPP TS 24.302 [12] (whether it is a Trusted or Untrusted Wi-Fi Access Network, see GSMA PRD IR.61 [3]) of the Wi-Fi Access Network in order to know which Wi-Fi Access procedure to initiate. The trust relationship of a Wi-Fi Access Network is made known to the UE if

1. The Wi-Fi Access supports 3GPP-based access authentication, the UE discovers the trust relationship during the 3GPP-based access authentication.
   or
2. The UE operates on the basis of pre-configured policy in the UE.

4.3 Wi-Fi Access Network Selection

4.4 Non-3GPP Access Authentication and Security
The UE and the network must fulfil the requirements as specified in section 5.3 of GSMA PRD IR.61 [3].

For UE and network supporting untrusted access:

- Profile of Internet Key Exchange version 2 (IKEv2) as specified in 3GPP TS 33.402 [9] shall be used;
- Profile of IP Security (IPsec) as specified in 3GPP TS 33.402 [9] shall be used;
- Fast re-authentication procedure as described in 3GPP TS 33.402 [9] shall be supported;
- UE shall support to initiate rekeying of both IKE_SA and IPSEC_SA. This should be triggered by a configurable timer;
- UE shall support to receive from Evolved Packet Data Gateway (ePDG) rekeying of both IKE_SA and IPSEC_SA; and
- Network Access Translation (NAT) traversal of IKEv2 and IPsec packets must be supported. The UE must send the NAT keep alive messages according to IETF RFC 3948 [18].

Depending on operator policy, fast re-authentication shall be possible to be used in these scenarios:

- The UE has a SWu tunnel (see GSMA PRD IR.61 [3]) for one Access Point Name (APN). The UE moves to 3GPP for a period and then moves back to Wi-Fi and re-establishes SWu tunnel.
- The UE has at least one existing PDN connection and wants to setup a new one.

### 4.5 Multiple PDN connections

The UE must support multiple concurrently-active PDN connections. The UE must also support MAPCON (Multi-Access PDN Connectivity) and in this context it must support at least one PDN connection over WLAN and at least one PDN connection over 3GPP access.

**Note:** For MAPCON support by the network, see section 6.5 in GSMA PRD IR.61 [3].

A UE supporting simultaneous radio transmission capability can use MAPCON to offload one or more PDN connections to Wi-Fi while keeping other PDN connections on cellular access.

MAPCON policies must be either pre-defined by the home operator and reside on the UE or be provided via ANDSF according to Release 12 3GPP TS 23.402 [6]. These MAPCON policies can state if and when a certain APN can be moved to Wi-Fi taking into account 3GPP locations (e.g. PLMN, tracking area and cell id), Wi-Fi location (i.e. SSID) location and if the UE is roaming or not.

**Note:** It is recommended to have MAPCON policies which keep at least one APN/PDN connection on LTE. This avoids frequent attach procedures, reducing the signaling load in the network (for a typical traffic model) and enables a quicker handover from Wi-Fi to LTE. Also, the UE must stay attached to LTE if CS Fallback or SMSoSGs is used.

### 4.6 APN Considerations for SIP Signalling and XCAP

When a trusted non-3GPP IP access is used, the UE and the network must support the procedure to signal APNs, as specified in section 16.8.1 of Release 12 of 3GPP TS 23.402 [6].

For SIP signalling, the IMS application in the UE must use the IMS well-known APN as defined in PRD IR.88 [7]; the UE must prevent non-IMS applications from using this APN.

For XCAP requests in Wi-Fi Access, the UE must be preconfigured or provisioned by the home operator either to use Wi-Fi access without PDN connection or with the APN to be used for XCAP requests in Wi-Fi access.
The APN for the PDN Connection used for XCAP requests in Wi-Fi Access may be either the same APN as defined in GSMA PRD IR.92 [1] or a different APN.

Note: If a different APN is used then the IP session continuity between 3GPP and non-3GPP IP access for the PDN Connection used for XCAP requests is not provided.

4.7 PDN Connectivity Service

4.7.1 Untrusted Access

4.7.1.1 General
When an untrusted non-3GPP IP access is used, the UE and the network must fulfill the requirements for PDN Connectivity Service as specified in section 5.6.1 of GSMA PRD IR.61 [3].

4.7.1.2 ePDG Selection
The UE shall select an ePDG as specified in section 7.2.1 of the Release 13 version of 3GPP TS 24.302 [12].

Note: Domain Name System (DNS) queries for ePDG selection are sent to the DNS server provided on the Wi-Fi Internet connection.

Editor's Note: How the UE is configured to always select an ePDG in the HPMN is FFS.

4.7.1.3 Connectivity Services
The UE must establish a separate SWu instance (i.e. a separate IPsec tunnel) for the PDN connection to the IMS well-known APN and to the APN to be used for XCAP requests, see also section 4.6. The UE must provide the APN during the initial attach procedure and during the attach to additional PDN procedure as specified in 3GPP TS 23.402 [6]. The APN shall be encoded as ID FQDN defined in IETF RFC 5996 [13]. The UE must use the same ePDG for all SWu instances, see also section 4.7.1.2.

Note: When the UE provides the IMS well-known APN, the APN Operator Identifier is not included as defined in section 6.3.7 of GSMA PRD IR.88 [7].

4.7.1.4 UE initiated disconnect
The UE initiated disconnect procedure shall be used by UE in the following scenarios:

- The UE is turned off and has one or more active SWu connections to ePDG;
- Wi-Fi connection is turned off and the UE has one or more active connections to ePDG that according to the UE/operator policy should not be handed over to cellular (i.e. depending on policies, see section 4.5); and
- Wi-Fi connection is turned off and UE has one or more active connections to ePDG and no cellular coverage.
For each PDN connection the UE should disconnect, it shall send a IKE Informational request with Delete Payload, which contains the SPI of the IKEv2 SA corresponding to the WLAN UE session to be disconnected.

4.7.1.5 Network initiated disconnect

The UE shall be able to receive an IKEv2 Informational request with Delete Payload, which contains the SPI of the IKEv2 SA corresponding to the WLAN UE session to be disconnected. The UE shall reply with an IKEv2 Information response.

**Note:** The network that initiates the disconnect can be triggered by many reasons like subscription changes, maintenance in network etc.

4.7.2 Trusted Access

When a trusted non-3GPP IP access is used, the UE and the network must fulfil the requirements for PDN Connectivity Service as specified in section 5.6.2 of GSMA PRD IR.61 [3].

4.8 Mobility Management

A UE supporting untrusted access must

- support seamless handover from LTE to Wi-Fi as described in 3GPP TS 23.402 [6];
- support seamless handover from Wi-Fi to LTE as described in 3GPP TS 23.402 [6].

The network can fulfil the requirements for mobility management as specified in section 6.2 of GSMA PRD IR.61 [3].

4.9 P-CSCF Discovery

The UE and the network must support the procedures for P-CSCF discovery via EPC via WLAN, as described in method IV of Annex R.2.2.1 of Release 13 3GPP TS 24.229 [5].

When establishing a PDN connection to the IMS well-known APN via WLAN, the UE must discover the P-CSCF address(es) as described in method IV of Annex R.2.2.1 of Release 13 3GPP TS 24.229 [5]. When an untrusted non-3GPP IP access is used:

- The UE must support and use the P-CSCF_IP6_ADDRESS attribute and the P-CSCF_IP4_ADDRESS attribute as described in Release 13 3GPP TS 24.302 [12]; and
- The network must support and use the P-CSCF_IP6_ADDRESS attribute, the P-CSCF_IP4_ADDRESS attribute or both as described in Release 13 3GPP TS 24.302 [12].

If P-CSCF address(es) were discovered using the method IV, the UE must use the P-CSCF address(es) discovered using the method IV as defined in section 5.1 and 3GPP TS 24.229 [5].

After the UE has discovered the P-CSCF and registered to IMS, the UE must use this P-CSCF as long as the IMS registration is valid, as described in sections B.2.2.1, L.2.2.1 and R.2.2.1 of Release 13 3GPP TS 24.229 [5].
5 Common Functionalities

5.1 IP Version

The UE and the network shall support both IPv4 and IPv6 for all protocols that are used for the service: SIP, SDP, RTP, RTCP and XCAP/HTTP.

Upon PDN connection procedure over untrusted non-3GPP IP access, the UE shall include proper attribute types in the CFG_REQUEST within the IKE_AUTH request message to request both IPv4 and IPv6 addresses as specified in section 7.2.2 of Release 11 version of 3GPP TS 24.302 [12].

Upon PDN connection procedure over trusted non-3GPP IP access, the UE must follow one of below procedures:

- For the trusted non-3GPP connection mode, using WLCP as signalling protocol for PDN connection handling; in order to request both IPv4 and IPv6 addresses the UE shall set the PDN type IE in the PDN CONNECTIVITY REQUEST message to IPv4v6 as specified in section 5.5.2 of Release 12 version of 3GPP TS 24.244 [16]
- For the trusted non-3GPP connection mode, using the EAP-AKA' extensions as signalling protocol for PDN connection handling; in order to request both IPv4 and IPv6 addresses, the UE shall set the PDN_TYPE item to IPv4v6 as specified in subclause 6.4.2.6.2 of Release 12 version of 3GPP TS 24.302 [12].

For PDN connection over untrusted or trusted non-3GPP IP access, if both IPv4 and IPv6 addresses are assigned for the UE, the UE must prefer the IPv6 address type.

After the UE has discovered the P-CSCF and registered to IMS with a particular IPv4 or IPv6 address, the UE must use this IP address for all SIP communication, as long as the IMS registration is valid. For all SDP and RTP/RTCP communication, the UE must use the IPv4 address used for SIP communication or an IPv6 address with the IPv6 prefix same as the IPv6 prefix of the IPv6 address used for SIP communication.

Note: There are certain situations where interworking between IP versions is required. These include, for instance, roaming and interconnect between networks using different IP versions. In those cases, the network needs to provide the interworking in a transparent manner to the UE.

5.2 IP Address Allocation

When an untrusted non-3GPP IP access is used, the UE and the network must support the IP address allocation as specified in section 4.7.3 of 3GPP TS 23.402 [6].

When a trusted non-3GPP IP access is used, the UE and the network must support the IP address allocation as specified in section 16.1.5.4 of 3GPP Release 12 TS 23.402 [6].
5.3 Emergency Service
The UE must use a cellular access for emergency call.

Note: Emergency call over EPC-integrated Wi-Fi is not specified in 3GPP.

5.4 Roaming Considerations
This profile supports IMS roaming as described in GSMS PRD IR.65 [19] and GSMA PRD IR.88 [7].
Annex A  Complementing IMS over Wi-Fi with CS

A.1 General
In order to offer its customer a seamless service, the operator may wish to complement the Wi-Fi access by utilising the CS radio access for voice and/or SMS. One possible deployment scenario is that Wi-Fi access is in areas without ubiquitous LTE coverage but with GERAN/UTRAN coverage. This annex describes the additional features that need to be implemented for the UEs and networks that wish to support such a deployment scenario.

A.2 Dual Voice Call Continuity
The network must support the Dual Radio Voice Call Continuity (DR-VCC) procedures for handover from Wi-Fi to CS as described as “PS – CS Access Transfer: PS to CS - Dual Radio” and the dynamic Session Transfer Number (STN) in Release 12 version of 3GPP TS 23.237 [17] and 3GPP TS 24.237 [15].

The UE must support the DR-VCC procedures for single active calls only and dynamic STN as described in Release 12 version of 3GPP TS 24.237 [15].

Note 1: The mechanisms to perform transfer of additional session / held state / conference call state / (pre-)alerting calls are out of scope of the present version of this profile.

Note 2: If the UE receives the feature-capability indicator g.3gpp.dynamic-stn, then the UE knows that the network supports DR-VCC from Wi-Fi to CS.

A.3 SMS Support
This section modifies the requirements defined in section 2.5 in the following ways:

If the UE is configured not to use SMS-over-IP as described in section A.7 of GSMA PRD IR.92 [1], then the UE must either attempt to stay attached to LTE to use SMS over NAS signalling as described in section 4.5 or the UE must attempt to stay attached to legacy 3GPP access (GERAN or UTRAN).
