1 Introduction

1.1 Overview

The IP Multimedia Subsystem (IMS) Profile for Voice and SMS, documented in this Permanent Reference Document (PRD), defines a profile that identifies a minimum mandatory set of features which are defined in 3GPP specifications that a wireless device (the User Equipment (UE)) and network are required to implement in order to guarantee an interoperable, high quality IMS-based telephony service and IMS-based and SGs-based Short Message Service (SMS) over Long Term Evolution (LTE) radio access. The scope includes the following aspects:

- IMS basic capabilities and supplementary services for telephony [Chapter 2].
- Real-time media negotiation, transport, and codecs [Chapter 3].
- LTE radio and evolved packet core capabilities [Chapter 4].
- Functionality that is relevant across the protocol stack and subsystems [Chapter 5].
- Additional features that need to be implemented for the UEs and networks that wish to support concurrent Circuit Switched (CS) coverage [Annex A].
- Additional features that only a subset of the IMS telephony operators needs to support in certain markets [Annex B].

The UE and network protocol stacks forming the scope of the IMS Profile for Voice and SMS are depicted in figure 1.1 below:

![Diagram of UE and Network Protocol Stacks](image)

Figure 1.1: Depiction of UE and Network Protocol Stacks in IMS Profile for Voice

The main body of this PRD is applicable for a scenario where IMS telephony is deployed over LTE in a standalone fashion without relying on any legacy infrastructure, packet or circuit switched. In order to be compliant with IMS Profile for Voice and SMS, the UEs and networks must be compliant with all of the normative statements in the main body.

Annex A defines the profile for an alternative approach where IMS telephony is deployed with a certain degree of reliance on an existing 3GPP circuit switched network infrastructure. Whenever there are additional requirements to the main profile, these are explicitly stated. In order to be compliant with the functionality described in Annex A, the UEs and networks...
must be compliant with all of the normative statements in Annex A as well as to all of the
normative statements in the main body of the PRD that are unaltered by Annex A.

1.2 Relationship to existing standards

1.2.1 3GPP specifications

This profile is solely based on the open and published 3GPP specifications as listed in the
Section 1.5. 3GPP Release 8, the first release supporting LTE, is taken as a basis. It should
be noted, however that not all the features mandatory in 3GPP Release 8 are required for
compliance with this profile.

Conversely, some features required for compliance with this profile are based on
functionality defined in 3GPP Release 9 or higher releases.

All such exceptions are explicitly mentioned in the following sections along with the relevant
Release 8 or higher 3GPP release specifications, respectively.

Unless otherwise stated, the latest version of the referenced specifications for the relevant
3GPP release applies.

1.3 Scope

This document defines a profile for voice over IMS over LTE, and for SMS over IMS and
SMS over SGs, by listing a number of Evolved Universal Terrestrial Radio Access Network
(E-UTRAN), Evolved Packet Core, IMS core, and UE features that are considered essential
to launch interoperable services. The defined profile is compliant with 3GPP specifications.
The scope of this profile is the interface between UE and network.

The profile does not limit anybody, by any means, to deploy other standardized features or
optional features, in addition to the defined profile.

### Acronym | Description
--- | ---
RAT | Radio Access Technology
RLC | Radio Link Control
RoHC | Robust Header Compression
RTCP | RTP Control Protocol
RTP | Real Time Protocol
SCC AS | Service Centralization and Continuity Application Server
SDP | Session Description Protocol
SigComp | Signalling Compression
simservs | MMTel supplementary services XML document
SIP | Session Initiation Protocol
SMSoIP | SMS over IP
SRB | Signalling Radio Bearer
SR-VCC | Single Radio Voice Call Continuity
TAS | Telephony Application Server
TDD | Time-Division Duplexing
TFO | Tandem-Free Operation
TrFO | Transcoder-Free Operation
UDP | User Datagram Protocol
UE | User Equipment
UICC | Universal Integrated Circuit Card
UM | Unacknowledged Mode
URI | Uniform Resource Identifier
USSD | Unstructured Supplementary Service Data
VoIP | Voice Over IP
XCAP | XML Configuration Access Protocol
XML | eXtensible Markup Language

### 1.4.2 Terms

| Term | Description |
--- | --- |
Data Off | A feature, which when activated, prevents transport via PDN connections in 3GPP access of all IP packets except IP packets required by Data Off Enabled Services. Data Off can be activated only when the UE roams or regardless whether the UE roams or not, depending on UE implementation. |
Data Off Enabled Service | A service that is enabled (e.g. based on device configuration) regardless of when Data Off is activated. |
Region | A part of a country, a country or a set of countries. |

2 IMS Feature Set

2.1 General

The IMS profile part lists the mandatory capabilities, which are required over the Gm and Ut reference points.

2.2 Support of generic IMS functions

2.2.1 SIP Registration Procedures

UE and IMS core network must follow the Session Initiated Protocol (SIP) registration procedures defined in 3GPP TS 24.229 [15]. In addition, when the conditions for performing IMS registration in bullets 2, 3, 4, 5 and 6 in section L.3.1.2 of 3GPP TS 24.229 [15] evaluate to true, then the UE must register with the IMS. Selective Disabling of 3GPP User Equipment Capabilities as defined in 3GPP TS 24.305 [18] is not mandated in this profile, therefore in the case where 3GPP TS 24.305 [18] Managed Object (MO) is not deployed, it is assumed that IMS is enabled in the terminal.

Note 1: UE registering with IMS in other situations is possible.
The UE must include IMS Communication Service Identifier (ICSI) value used to indicate the IMS Multimedia Telephony service, that being urn:urn-7:3gpp-service.ims.icsi.mmtel per 3GPP TS 24.173 [14], using procedures as defined in section 5.1.1.2.1 of 3GPP TS 24.229 [15]. If the UE supports SMS over IP (see section 2.5 and A.7), it must include feature tag used to indicate SMS over IP service, that being +g.3gpp.smsip as defined in section 5.3.2.2 of 3GPP TS 24.341 [19].

UE and IMS core network must support network-initiated de-registration as defined in 3GPP TS 24.229 [15].

The UE must subscribe to the registration event package as defined in section 5.1.1.3 of 3GPP TS 24.229 [15].

The UE must include an IMEI URN (see 3GPP TS 23.003 [2] section 13.8) in the "+sip.instance" header field parameter (Instance ID) of the Contact address.

All IMS public user identities provided in the implicit registration set used for VoLTE by the IMS core network must be alias user identities and must include a Tel URI. The following public user identity must be assigned to the implicit registration set used for VoLTE and it must be used by the UE when registering for VoLTE:

a) When ISIM is used, the public user identity in the first (or only) record in the Elementary File in the ISIM (see 3GPP TS 31.103 [44] section 4.2.4); or
b) The temporary public user identity derived from the IMSI (3GPP TS 24.229 [15]).

No other implicit registration set must be used for VoLTE.

Note 2: According to 3GPP TS 23.228 [7], a public user identity is an alias of another public user identity if both identities belong to the same implicit registration set, are linked to the same service profile and have the same service data configured for each and every service.

2.2.2 Authentication

UE and IMS core network must follow the procedures defined in 3GPP TS 24.229 [15] and 3GPP TS 33.203 [45] for authentication with IMS Authentication and Key Agreement (IMS-AKA), Sec-Agree and IPSec. Support of integrity protection is mandatory for both UE and network. Support of confidentiality protection is optional in the network, considering that lower layer security is available.

The IMS core network must support the procedures for IM Services Identity Module (ISIM) based authentication. Support for ISIM based authentication in the UE is mandatory.

The UE and IMS core network must support the procedures for USIM based authentication if there is no ISIM present on the Universal Integrated Circuit Card (UICC) as defined in 3GPP TS 23.228 [7], Annex E.3.1 and 3GPP TS 24.229 [15], Annex C.2. This includes support for the P-Associated Uniform Resource Identifier (URI) header to handle barred IP Multimedia Public Identities (IMPUs).

UE and IMS core network must support the procedures for authentication at the Ut reference point as specified in 3GPP TS 24.623 [28].
Note 1: It is recommended that the UE supports the Generic Authentication Architecture procedures specified in 3GPP TS 24.623 [28], 3GPP TS 33.222 [46] and 3GPP TS 24.109 [12].

The UE must support receiving 2xx response to the HTTP request without being challenged by 401 Unauthorized response.

Note 2: The above authentication scenario is possible only if the APN for XCAP (see section 4.3.1) is routed to home PLMN. The home network is able to authenticate the UE without challenging the UE for Ut authentication.

2.2.3 Addressing

The UE and IMS core network must support Public User Identities as defined in section 13.4 of 3GPP TS 23.003, which includes all of the following types of addresses:

- Alphanumeric SIP-URIs
  - Example: sip:voicemail@example.com
- MSISDN represented as a SIP URI:
  - Example: sip:+447700900123@example.com;user=phone
- MSISDN represented as a Tel URI:
  - Example: tel:+447700900123

Note: Further requirements for support of Public User Identities in the network are specified in IR.65 [65].

The UE and IMS core network must support the local numbers as defined in Alternative 2 in Sections 5.1.2A.1.3 and 5.1.2A.1.5 in 3GPP TS 24.229 [15]. That is, the UE must set the dial string containing the local number to the user part of SIP URI in the Request URI, and set the "user=phone" parameter, with the "phone-context" Tel URI parameter to the user part.

The UE must set the “phone-context” parameter as defined in section 7.2A.10 in 3GPP TS 24.229 [15]. That is, for home local numbers the UE must set the “phone-context” parameter to the home domain name, as it is used to address the SIP REGISTER request. The UE and network have the option to support geo-local numbers. If the UE supports geo-local numbers, it must set the “phone-context” parameter as with home local numbers, but prefixed by the “geo-local.” string, according to the Alternative 8 in Section 7.2A.10.3 in 3GPP TS 24.229 [15].

The UE and IMS core network must support the P-Called-Party-ID header field; the network must use this header field as defined in 3GPP TS 24.229 [15].

The support of Globally Routable User agent URIs (GRUUs) by UE or network is not required.
2.2.4 Call Establishment and Termination

UE and IMS core network must support reliable provisional responses.

The UE shall be able to accept an INVITE request without an SDP offer and the UE shall include an SDP offer with audio media in the first non-failure reliable response to an INVITE request without SDP offer.

**Note:** Other media can be included in the SDP offer in the first non-failure reliable response.

The UE must indicate in the SDP of the initial INVITE that the audio media is send-receive i.e. either by including the direction attribute “a=sendrecv” or by omitting the direction attributes.

For the purpose of indicating an IMS communication service to the network, the UE must use an ICSI value in accordance with 3GPP TS 24.229 [15]. The ICSI value used must indicate the IMS Multimedia Telephony service, which is urn:urn-7:3gpp-service.ims.icsi.mmtel, as specified in 3GPP TS 24.173 [14].

The usage of preconditions is discussed in Section 2.4.

2.2.5 Forking

Forking in the network is outside the scope of the present document. However for interoperability and forward-compatibility reasons, the UE must be ready to receive responses generated due to a forked request and behave according to the procedures specified in IETF RFC 3261 [55], section 4.2.7.3 of 3GPP TS 23.228 [7] and 3GPP TS 24.229 [15].

Furthermore, the UE should be able to maintain at least forty (40) parallel early dialogues until receiving the final response on one of them and the UE must support receiving media on one of these early dialogues.

**Note:** An early dialog that is maintained is one where a SIP 18x response has been received and the early dialogue has not been terminated (e.g. by receipt of a SIP 199 response) prior to receiving a SIP 2xx response.

2.2.6 The use of Signalling Compression

The UE must not use SIGCOMP when the initial IMS registration is performed in E-UTRAN access as specified in Release 10 3GPP TS 24.229 [15].

**Note:** Although this version of the profile focuses on E-UTRAN, if the initial IMS registration occurs in other IP Connectivity Accesses then SIGCOMP can be used by the UE.
2.2.7 Early media and announcements

If the UE detects that in-band information is received from the network as early media, the in-band information received from the network shall override locally generated communication progress information as described in 3GPP TS 24.628 [71].

If the UE supports the P-Early-Media header field as defined in IETF RFC 5009 [74], the UE shall:

a) include a P-Early-Media header field with the “supported” parameter to INVITE requests it originates; and
b) if a P-Early-Media header field has been received, behave as specified in Release 12 version of 3GPP TS 24.628 [71].

2.3 Supplementary Services

2.3.1 Supplementary Services Overview

Supplementary services must be supported as defined as part of 3GPP MMTel TS 24.173 [14], with the constraints described in this section.

UE and Telephony Application Server (TAS) must support the supplementary services listed in Table 2.1. The provisioning of these supplementary services for a subscriber is optional and is an operator decision.

Note 1: Support of other supplementary services is out of scope of this document.

2.3.2 Supplementary Service Configuration

For supplementary service configuration, the UE and IMS core network must support XCAP at the Ut reference point as defined in 3GPP TS 24.623 [28].

The home operator can configure the UE with an XCAP Root URI as specified in 3GPP TS 24.623 [28]. If the UE has not been configured with an XCAP Root URI, then the UE must construct an XCAP root URI as defined in section 13.9 of 3GPP TS 23.003 [2].

As XCAP User Identity (XUI) the UE must use the default public user identity received in P-Associated-URI header in 200 OK for REGISTER.

When not registered with IMS, the UE must use the default public user identity received during the last successful registration as in Section 2.2.1 in this document.

If the UE receives an HTTP 404 (Not Found) response when attempting to access the entire simservs XML document (i.e. a node selector is not included in the Request-URI of the XCAP request), or the UE does not have a stored default public user identity, then:

- if the UE has an ISIM, then the UE must use the public user identity in the first (or only) record in the EFIMPU Elementary File in the ISIM (see section 4.2.4 of 3GPP TS 31.103 [44]) as XUI in further XCAP requests sent until the next successful IMS registration.
- if the UE has a USIM but not an ISIM, then the UE must use the temporary public user identity derived from the IMSI (see section 13.4B of 3GPP TS 23.003 [2]) as XUI in further XCAP requests sent until the next successful IMS registration.

Note 1: If the UE attempts to access a fragment of the simservs XML document (i.e. a node selector is included in the Request-URI of the XCAP request), and the UE receives a HTTP 404 (Not Found) response, the UE is allowed to continue attempting to access the simservs XML document. If the UE continues to receive a HTTP 404 (Not Found) response when attempting to access a fragment of the simservs XML document, the UE can attempt to access the entire simservs XML document to determine if the XUI is valid.

Note 2: If the XUI is derived from the IMPU stored on the ISIM or derived from the temporary IMPU, then the UE does not share such XUI with another UE in order to prevent the revealing of a potentially barred IMPU.

The UE must configure settings of one supplementary service only per XCAP request. If the supplementary service to be configured contains a <ruleset> element with multiple <rule> elements as defined in IETF RFC 4745 [73] (e.g. as for Communication Diversion (CDIV),

---

Table 2.1 Supplementary services

| Note 2: | Recommended options are described in sections 2.3.3 - 2.3.10. |
| Note 3: | Barring of International Calls is a 3GPP Release 9 feature. |
Communication Barring (CB)), then the UE must modify at most one <rule> element of the supplementary service per XCAP request.

The UE must perform XCAP PUT and DELETE as conditional operations using the If-Match header field as defined in section 7.11 of IETF RFC 4825 [75].

When modifying a supplementary service, and if there is an existing <rule> element containing the matching <conditions> element, the UE must modify the child elements of the existing <rule> element. Otherwise, if no matching <rule> element is found, the UE must insert a new <rule> element with a rule ID different from any existing rule ID in the XML document.

When deactivating a <rule> element for a supplementary service, and if there is a <rule> element containing the matching <conditions> element, without <rule-deactivated> condition, the UE must insert the <rule-deactivated> condition in the <conditions> element of the <rule> element.

2.3.3 Ad-Hoc Multi Party Conference

The UE and IMS core network must support the procedures defined in 3GPP TS 24.605 [21], with the clarifications defined in this sub section.

   Note 1: As per Section 4.2 of 3GPP TS 24.605 [21], the invocation and operation for conferencing is described in 3GPP TS 24.147 [13].

For conference creation, the UE and IMS core network must support Three Way Session creation as described in Section 5.3.1.3.3 of 3GPP TS 24.147 [13]. The UE must apply option 2b) when inviting the remote user to the conference.

When inviting other users to a conference, the UE and IMS core network must support the procedure described in Section 5.3.1.5.3 of 3GPP TS 24.147 [13]. The UE must send the REFER method by using the existing dialog for a conference session between the UE and the IMS core network (conference server). The UE must add the Replaces header to the Refer-to header field in the REFER request, as described in Section 5.3.1.5.3 of 3GPP TS 24.147 [13].

   Note 2: In Three-Way session creation procedures, the UE has an existing session with the REFER target.

The UE can and the IMS core network must support the procedures in 3GPP TS 24.605 [21] for subscription to conference state events. The SUBSCRIBE to conference state events must be sent outside the INVITE dialog between the UE and the conference server. The IMS core network can support all, or a subset of the elements and attributes in IETF RFC 4575 [61]. As a minimum, the IMS core network must support the following elements and attributes:

- Conference-info: entity
- Maximum-user-count
- Users
- User: entity
- Display-text
• Endpoint: entity
• Status (supported values: connected, disconnected, on-hold)

The UE and IMS core network must support audio media for the conference session.

**Note 3:** Support of other media types is out of scope of the document.

Floor control for conferencing as described in section 8 in 3GPP TS 24.147 [13] is not required.

Consent procedures for list server distribution as described in 5.3.1.7 in 3GPP TS 24.147 [13] are not required.

### 2.3.4 Communication Waiting

The UE and IMS core network must support the terminal based service, as described in 3GPP TS 24.615 [27]. The network-based service is not required. The Communication Waiting (CW) indication as defined in Section 4.4.1 of 3GPP TS 24.615 [27] is not required. The UE is required to support Alert-Info, with values as specified in 3GPP TS 24.615 [27]. The UE must provide the ability for the user to activate, deactivate and interrogate the terminal based service without using UE to network signaling (e.g. XCAP/Ut).

### 2.3.5 Message Waiting Indication

UE must and IMS core network can support the Message Waiting Indication (MWI) event package, as defined in 3GPP TS 24.606 [22] and IETF RFC 3842 [60].

### 2.3.6 Originating Identification Restriction

UE and IMS core network must support the SIP procedures in 3GPP TS 24.607 [23]. Service configuration as described in Section 4.10 of 3GPP TS 24.607 [23] is optional.

### 2.3.7 Terminating Identification Restriction

UE and IMS core network must support the SIP procedures in 3GPP TS 24.608 [24]. Service configuration, as described in section 4.9 of 3GPP TS 24.608 [24], is optional.

### 2.3.8 Communication Diversion

The UE and IMS core network must support the SIP procedures in 3GPP TS 24.604 [20] for Communication Diversion (CDIV). For CDIV service activation, deactivation, and interrogation (XCAP operations), the UE and IMS core network must support the XML rules for Call Forwarding Unconditional and the conditions, actions and elements listed in Table 2.2.

The UE and IMS core network shall support the XML rules as described in 3GPP TS 24.604 [20] section 4.9.1. The UE must support the History-Info header for identification of diverting parties at the terminating side and of diverted-to parties at the originating side. At the terminating side, a History-Info entry shall be used for the identification of the diverting party only if another History-Info entry exists that has assigned the next index in sequence AND includes a cause value. At the originating side only History-Info entries including a cause value shall be used for presentation of the diverted-to party.
Note 1: Support of subscription options and other conditions and actions are out of scope of the document.

Table 2.2 Supported conditions, actions and elements in CDIV

Note 2: The GSM version of Communication Forwarding on Not Reachable (CFNRc) implies diversion when the user is not registered in the CS core or cannot be reached. To mimic this behaviour, it is recommended that an UE activates both the CFNRc (CDIV using condition not-reachable) and the Communication Forwarding on Not Logged-in (CFNL) (CDIV using condition not-registered) to the same target.

In addition to the requirements in section 2.3.2, when configuring settings for the Communication Diversion supplementary service the UE must configure only one of the following in an XCAP request:

- Communication diversion supplementary service activation, no-reply-timer or both.
- For the communication diversion services supported in this PRD, elements of one <rule> element for communication diversion supplementary service only.

2.3.9 Communication Barring

UE and IMS core network must support the SIP procedures in 3GPP TS 24.611 [26]. For service activation, deactivation, and interrogation (XCAP operations), the UE and IMS core network must support the XML rules for Barring of All Incoming Calls, Barring of All Outgoing Calls and the conditions listed in Table 2.3. UE and IMS core network shall support the XML rules as described in 3GPP TS 24.611 [26] section 4.9.1.3.

Note: Support of other conditions is out of scope of the document.

</tbody>
</table>

Table 2.3 Supported conditions in CB
In addition to the requirements in section 2.3.2, when configuring settings for the Communication Barring supplementary service the UE must modify only one of the following in an XCAP request:

- Incoming communication barring supplementary service activation
- Outgoing communication barring supplementary service activation
- For the communication barring services supported in this PRD, elements of one <rule> element for communication barring supplementary service only.

2.3.10 Communication Hold
The UE invoking the HOLD service must not send any media to the other party.

2.4 Call Set-up Considerations

2.4.1 SIP Precondition Considerations
Unless preconfigured otherwise by the home operator, the UE must support and use the SIP preconditions framework, as specified in 3GPP TS 24.229 [15].

The network may disable the use of preconditions in the network; the means by which this takes place is outside the scope of this document.

The terminating UE implementation must not rely on the use of preconditions by the originating UE.

Upon receiving an INVITE request, when preconditions are not used by the originating UE or preconditions are disabled by the network, and the local resources required at the terminating UE are not available, the terminating UE, according to the Release 13 version of 3GPP TS 24.229[15], must:

- send a 183 (Session Progress) response containing SDP;
- not alert the user until resources are reserved successfully on the terminating side;
- and
- not send a 180 (Ringing) response until resources are reserved successfully on the terminating side.

2.4.2 Integration of resource management and SIP

2.4.2.1 Loss of PDN connectivity
If the Packet Data Network (PDN) connectivity between a UE and the network is lost, the network must terminate all ongoing SIP sessions related to this UE, according to the procedures in Section 5.2.8 of 3GPP TS 24.229 [15] (for example, when the P-CSCF receives an abort session request from the Policy and Charging Rules Function (PCRF)).

If the UE discovers (for example during a TAU procedure) that PDN connectivity had been lost, then the UE must attempt to re-establish the PDN connection. This will trigger the network to initiate a new SIP signalling bearer in conjunction with the PDN connection establishment.
When the UE regains PDN and IP connectivity, if the IP address has changed or the IMS registration expired during the period of absence of IP connectivity then the UE must perform a new initial registration to IMS.

2.4.2.2 Void

2.4.2.3 Loss of media bearer and Radio Connection

If a Guaranteed Bit Rate (GBR) bearer used for voice fails to get established, or is lost mid-session, then the network must terminate the session associated to the voice stream according to the procedures in section 5.2.8 in TS 24.229 [15] (P-CSCF must be informed about loss of bearer by the PCRF).

Note 1: The loss of GBR bearer may be due to loss of radio connection indicated by a S1 release with cause “Radio Connection With UE Lost” and then followed by the MME Initiated Dedicated Bearer Deactivation procedure for the GBR bearer used for voice. Or, the GBR bearer may be lost or not established, due to the current resource and radio situation. However, termination of the SIP session due to loss of the voice GBR bearer is the only way for the system to stop the IMS level charging (quickly) when the UE loses radio connection.

Note 2: If other media types are used, and a GBR bearer used for another media type fails to get established, or is lost mid-session, then the network, based on its policies, has the option to either allow the session to continue as is, or terminate the SIP session that the GBR bearer is associated with. (The network can handle loss of video in a video call in such a way that the session to continue as voice-only).

If a SIP session includes media streams, and if a dedicated bearer for any media stream fails to get established, or is lost mid-session, the UE must, based on its preferences, modify, reject or terminate the SIP session that the dedicated media bearer is associated with, according to section 6.1.1 in 3GPP TS 24.229 [15]. The UE can act differently per media type.

Note 3: In the case where voice bearer is lost or fails to get established, the network will, in normal cases, release the session as described in the beginning of the section. As a complement to this, the UE must have internal logic to react to the detection of loss of bearer/radio connection to handle its internal state. In the case of multimedia communication, if the radio connection is not lost, but a bearer not used for voice is lost, then the UE must decide if the session should be maintained as is, or should be modified, or should be released.

If the UE loses radio connectivity and the IMS registration expires prior to regaining radio connectivity, then upon regaining radio connectivity the UE must perform a new initial registration to IMS.
2.4.3 Voice Media Considerations
The Session Description Protocol (SDP) offer/answer for voice media must be formatted as specified in Section 6.2.2 of 3GPP TS 26.114 [35], with the restrictions included in the present document. If the Enhanced Voice Services (EVS) codec is included, then the offer/answer for voice media must be formatted as specified in Section 6.2.2 of 3GPP Release 12 TS 26.114 [35], with the restrictions included in the present document.

If multiple audio bandwidths are offered by the UE for speech communication, then the codec preference order must be as specified in clauses 5.2.1.5 and 5.2.1.6 of Release 12 3GPP TS 26.114 [35].

2.4.4 Multimedia Considerations
UEs using the full set of media functions can send SDP offers containing multiple “m=” lines to indicate the wish to establish a more advanced multimedia session than this profile defines.

If one of these “m=” lines indicates the wish of establishing an audio (voice) session (using a compatible codec), then the UE following this profile must accept the offer and allow the use of whatever media streams it supports. The UE must set the port number to zero for the media streams it does not support.

Note 1: This means that a voice-only UE will accept a video call request, but the call will automatically be transformed to a voice-only call. In CS telephony, the call is rejected when the terminating client cannot support all offered media (that is, a voice-only terminal will reject a video call offer). Hence, this section describes a behavior that is new to telephony.

UEs using the full set of media functions, have the option to try to update the session by sending SIP (re-)INVITE requests that include SDP offers containing multiple “m=” lines, to indicate the desire to expand the session into a more advanced multimedia session. The UE following this profile must accept such offer and allow the use of whatever media streams it supports. The UE must, in the SDP answer, set the port number to zero for the media streams it does not support.

Note 2: This means that a voice-only UE will accept a request to update the session to video using a SIP 200 OK response. But since the SDP answer will disable the video stream, the call will continue as a voice-only call.

2.5 SMS over IP
The UE must implement the roles of an SM-over-IP sender and an SM-over-IP receiver, according to the procedures in Sections 5.3.1 and 5.3.2 in 3GPP TS 24.341 [19].

The status report capabilities, delivery reports, and notification of having memory available, according to Sections 5.3.1.3, 5.3.2.4 and 5.3.2.5 in 3GPP TS 24.341 [19] must be supported.

The IMS core network must take the role of an IP-SM-GW and support the general procedures in Section 5.3.3.1 of 3GPP TS 24.341 [19], and the functions (answering of
routing information query, and transport layer interworking) according to the procedures in Sections 5.3.3.3 and 5.3.3.4 in 3GPP TS 24.341 [19].

3 IMS Media

3.1 General
This section endorses a set of media capabilities specified in 3GPP TS 26.114 [35]. The section describes the needed SDP support in UEs and in the IMS core network and it describes the necessary media capabilities both for UEs and for entities in the IMS core network that terminate the user plane. Examples of entities in the IMS core network that terminate the user plane are the MRFP and the MGW.

3.2 Voice Media

3.2.1 Codecs
The UE must support the Adaptive Multi-Rate (AMR) speech codec, as described in 3GPP TS 26.071 [29], 3GPP TS 26.090 [31], 3GPP TS 26.073 [30], and 3GPP TS 26.104 [34], including all eight (8) modes and source rate controlled operations, as described in 3GPP TS 26.093 [32]. The UE must be capable of operating with any subset of these eight (8) codec modes.

The UE must support AMR wideband codec as described in 3GPP TS 26.114 [35], 3GPP TS 26.171 [38], 3GPP TS 26.190 [40], 3GPP TS 26.173 [39] and 3GPP TS 26.204 [42], including all nine (9) modes and source controlled rate operation 3GPP TS 26.193 [41]. The UE shall be capable of operating with any subset of these nine (9) codec modes. If the EVS codec is supported, then the EVS AMR-WB IO mode may be used as an alternative implementation of AMR-WB as specified in clause 5.2.1.4 of Release 12 3GPP TS 26.114 [35].

If super-wideband or fullband speech communication is offered, then the UE must support the EVS codec as described in Rel-12 3GPP TS 26.114 [35], 3GPP TS 26.441 [76], 3GPP TS 26.445 [79], 3GPP TS 26.442 [77], 3GPP TS 26.443 [78], 3GPP TS 26.447 [81], 3GPP TS 26.449 [82], 3GPP TS 26.450 [83] and 3GPP TS 26.451 [84].

When transmitting using the AMR codec, the AMR-WB codec or the EVS AMR-WB IO mode codec, then the UE must be capable of aligning codec mode changes to every frame border, and must also be capable of restricting codec mode changes to be aligned to every other frame border, for example as described for UMTS_AMR_2 in 3GPP TS 26.103 [33] based on the SDP offer-answer negotiation. The UE must also be capable of restricting codec mode changes to neighbouring codec modes within the negotiated codec mode set based on the SDP offer-answer negotiation.

When receiving using the AMR codec, the AMR-WB codec or the EVS AMR-WB IO mode codec, then the UE and the entities in the IMS core network that terminate the user plane must allow codec mode changes at any frame border and to any codec mode within the negotiated codec mode set. As an exception, entities in the network that provide Circuit Switched (CS) interworking and apply Transcoder-Free Operation (TrFO) of Tandem-Free
Operation (TFO) shall accept codec mode changes in accordance with the capabilities at the CS network side.

Entities in the IMS core network that terminate the user plane supporting speech communication and supporting TFO and/or TrFO shall support:

- AMR speech codec modes 12.2, 7.4, 5.9 and 4.75 as described in 3GPP TS 26.071 [29], 3GPP TS 26.090 [31], 3GPP TS 26.073 [30], and 3GPP TS 26.104 [34].

Entities in the IMS core network that terminate the user plane supporting wideband speech communication and supporting TFO and/or TrFO shall support:

- AMR-WB speech codec modes 12.65, 8.85 and 6.60 as described in 3GPP TS 26.171 [38], 3GPP TS 26.190 [40], 3GPP TS 26.173 [39], and 3GPP TS 26.204 [42].

Entities in the IMS network that provide transcoding-free interworking to the CS network shall be capable of requesting the UE to restrict codec mode changes to be aligned to every other frame border and also be capable of requesting the UE to restrict codec mode changes to neighbouring codec modes within the negotiated codec mode set.

Note: Restrictions in codec mode changes are only required for transcoder-free interworking with a CS GSM MS (Mobile Station).

3.2.2 RTP Profile and SDP Considerations

3.2.2.1 RTP Profile
The Real Time Protocol (RTP) profile, Audio Video Profile (AVP) IETF RFC 3551 [57] must be used.

3.2.2.2 SDP Offer Considerations
The SDP Capability Negotiation framework described in IETF RFC 5939 [64] must not be used in the SDP offer when the AVP profile is used.

3.2.2.3 SDP Answer Considerations
The UE and the IMS core network must be able to receive and answer to an SDP offer which uses SDPCapNeg. The answer must indicate the use of the RTP AVP profile.

Note: In 3GPP TS 26.114 [35] section 6.2.1a, it is recommended that that a UE or the IMS core network use the SDPCapNeg attributes ‘tcap’ and ‘pcfg’ to indicate the support of both the RTP profiles AVP and AVPF. Hence, to be forward compatible with equipment using the full set of media functions, a minimum set UE and the IMS core network must be able to ignore the SDPCapNeg attributes and answer to the RTP AVP profile in the offer.

3.2.2.4 SDP Bandwidth Negotiation
The UE and network must use the b=AS parameter in SDP offers and answers for bandwidth negotiation as defined in section 6.2.5.2 of 3GPP Release 10 TS 26.114 [35] for UEs and networks that support AMR and AMR-WB, and 3GPP Release 12 TS 26.114 [35] for UEs and networks that support EVS.
3.2.3 Data Transport

The UE and the entities in the IMS core network that terminate the user plane must use RTP over UDP as described in IETF RFC 3550 [56] and IETF RFC 768 [53], respectively, to transport voice and use symmetric RTP as defined in IETF RFC 4961 [72].

3.2.4 RTCP Usage

The RTP implementation must include an RTP Control Protocol (RTCP) implementation according to IETF RFC 3550 [56].

The UE and the entities in the IMS core network that terminates the user plane must use symmetric RTCP as defined in IETF RFC 4961 [72].

The bandwidth for RTCP traffic must be described using the "RS" and "RR" SDP bandwidth modifiers at media level, as specified by IETF RFC 3556 [58]. Therefore, a UE must include the "b=RS:" and "b=RR:" fields in SDP, and a UE and the entities in the IMS core network that terminate the user plane must be able to interpret them. If the "b=RS:" field or "b=RR:" field or both these fields are not included in a received SDP (offer or answer), then the UE shall use the recommended default value for the missing field(s) as defined in IETF RFC 3556 [58].

The RTCP transmission must be turned on by the UE and the entities in the IMS core network that terminates the user plane.

**Note 1:** The RTCP is based on the periodic transmission of control packets to all participants in the session, as described in IETF RFC 3550 [56]. In context of the Voice over IMS profile, the primary uses of RTCP are voice quality monitoring, and to provide link aliveness information while the media are on hold. The latter implies that the RTCP transmission must continue when the media are on hold.

The UE and the entities in the IMS core network that terminates the user plane must set the sending frequency of control packets to a value calculated from the values of "RS" and "RR" SDP bandwidth modifiers according to rules and procedures in IETF RFC 3550 [56]. The UE must set the "RS" and "RR" SDP bandwidth modifiers such that the calculated RTCP sending frequency is equal or less than 5 seconds, in order to allow a sufficiently tight inactivity detection.

The UE and the entities in the IMS core network that terminates the user plane must support the transmission of RTCP packets formatted according to the rules in IETF RFC 3550 [56] and with the clarifications below:

RTCP compound packet format must be used. When sent, the compound packet must include one report packet and one source description (SDES) packet. When no RTP packets have been sent in the last two reporting intervals, a Receiver Report (RR) should be sent. Some implementations may send a Sender Report (SR) instead of a Receiver Report (RR), and this must be handled and accepted as valid.
The SR, RR and SDES packets must be formatted as described in detailed below:

**Sender report (SR) and Receiver Report (RR) RTCP packet**

- Version 2 must be used.
- Padding must not be used (and therefore padding bit must not be set).

**Source description (SDES) RTCP packet**

- Version and Padding as described for SR packet.
- The SDES item CNAME must be included in one packet.
- Other SDES items should not be used.

**Note 2:** Because the randomly allocated SSRC identifier may change, the CNAME item must be included to provide the binding from the SSRC identifier to an identifier for the source that remains constant. Like the SSRC identifier, the CNAME identifier must be unique among all other participants within one RTP session.

To be forward compatible and interwork with legacy equipment, the UE and the entities in the IMS core network that terminates the user plane must be able to receive all types of RTCP packets, according to the rules specified in IETF RFC 3550 [56].

### 3.2.5 Speech Payload Format Considerations

The Adaptive Multi Rate (AMR) and Adaptive Multi-Rate Wideband (AMR-WB) payload format(s) specified in IETF RFC 4867 [63] must be supported. If Enhanced Voice Services (EVS) codec is supported, then the EVS payload format specified in Release 12 3GPP TS 26.445 [79] must be supported.

The UE and the entities in the IMS core network that terminates the user plane must support the bandwidth-efficient and the octet-aligned formats of the AMR and AMR-WB payload formats. The UE and the entities in the IMS core network that terminates the user plane must request the use of bandwidth-efficient format of the AMR and AMR-WB payload format when originating a session.

The UE and the entities in the IMS core network that terminates the user plane must send the number of speech frames, or fewer, encapsulated in each RTP packet, as requested by the other end using the ptime SDP attribute.

The UE and the entities in the IMS core network that terminates the user plane must request to receive one speech frame encapsulated in each RTP packet, but must accept any number of frames per RTP packet, up to the maximum limit of 12 speech frames per RTP packet.

**Note 1:** This means that the ptime attribute must be set to 20 and the maxptime attribute must be set to 240 in the SDP negotiation.

IMS media gateway not supporting redundancy may limit the maxptime attribute to 80 in the SDP negotiation.

The UE and the entities in the IMS core network that terminates the user plane must be able to sort out the received frames based on the RTP Timestamp and must remove duplicated...
frames, if present. If multiple versions of a frame are received, for example, encoded with different bit rates, then the frame encoded with the highest bit rate should be used for decoding.

**Note 2:** UEs and the entities in the IMS core network that terminate the user plane, using the full set of media functions, have the option to send frames several times (for redundancy) to adapt for conditions with high packet-loss ratios. It is thus important that a UE and the entities in the IMS core network that terminates the user plane which use this profile are capable to detect and drop the duplicated frames.

RTCP-APP must not be used for Codec Mode Requests (CMR).

**Note 3:** As the speech media uses the RTP AVP profile as specified in section 3.2.2.1, the adaptation using RTCP may be too slow and therefore unsuitable.

### 3.2.6 Jitter Buffer Management Considerations

The minimum performance requirements for jitter buffer management of voice media, as described in 3GPP TS 26.114 [35] must be met. If the EVS codec is supported, then the jitter buffer management requirements in section 8.2 of Release 12 3GPP TS 26.114 [35] must be met.

### 3.2.7 Front End Handling

UEs used for IMS voice services must conform to the minimum performance requirements on the acoustic characteristics of 3G terminals specified in 3GPP TS 26.131 [36]. The codec modes and source control rate operation (DTX) settings must be as specified in 3GPP TS 26.132 [37].

### 3.3 DTMF Events

The UE and the IMS core network must support DTMF events as defined in Annex G of 3GPP TS 26.114 [35].

### 4 Radio and Packet Core Feature Set

#### 4.0 General

The LTE radio capabilities included in this specification are applicable to UE and network supporting FDD LTE only, TDD LTE only, or both FDD and TDD LTE.

#### 4.1 Robust Header Compression

UE and network must support Robust Header Compression (RoHC) as specified in 3GPP TS 36.323 [51], IETF RFC 3095 [54] and IETF RFC 4815 [62]. The UE and network must be able to apply the compression to packets that are carried over the radio bearer dedicated for the voice media. At minimum, UE and network must support "RTP/UDP/IP" profile (0x0001) to compress RTP packets and "UDP/IP" profile (0x0002) to compress RTCP packets. The UE and network must support these profiles for both IPv4 and IPv6.
4.2 LTE Radio Capabilities

4.2.1 Radio Bearers

The UE must support the following combination of radio bearers for Voice over IMS profile (see Annex B in 3GPP TS 36.331 [52]):

SRB1 + SRB2 + 4 x AM DRB + 1 x UM DRB

The network must support the following combination of radio bearers:

SRB1 + SRB2 + 2 x AM DRB + 1 x UM DRB

One AM Data Radio Bearer (DRB) is utilized for Evolved Packet System (EPS) bearer with Quality of Service Class Indicator (QCI) = 5 and another AM DRB for EPS bearer with QCI = 8/9. UM DRB is utilized for EPS bearer with QCI = 1. EPS bearer usage is described in Section 4.3.

4.2.2 DRX Mode of Operation

In order to maximize lifetime of the UE battery, LTE Discontinuous Reception (DRX) method as specified in 3GPP TS 36.300 [49] and 3GPP TS 36.321 [50] must be deployed. Support of DRX is mandatory for both UE and network.

4.2.3 RLC configurations

Radio Link Control (RLC) entity must be configured to perform data transfer in the following modes as specified in 3GPP TS 36.322 [69]:

- Unacknowledged Mode (UM) for EPS bearers with QCI = 1
- Acknowledged Mode (AM) for EPS bearers with QCI = 5
- Acknowledged Mode (AM) for EPS bearers with QCI = 8/9

Voice service can tolerate error rates on the order of 1%, while benefiting from reduced delays, and is mapped to a radio bearer running the RLC protocol in unacknowledged mode (UM).

EPS bearer usage is described in Section 4.3.

4.2.4 GBR and NGBR Services, GBR Monitoring Function

Voice is one of the LTE services that require a guaranteed bit rate (GBR) bearer, although it is a very low data rate compared to LTE peak rates, as described in 3GPP TS 23.401 [10]. The GBR bearer for voice requests dedicated network resources related to the Guaranteed Bit Rate (GBR) for AMR codec values. The network resources associated with the EPS bearer supporting GBR must be permanently allocated by admission control function in the eNodeB at bearer establishment. Reports from UE, including buffer status and measurements of UE’s radio environment, must be required to enable the scheduling of the GBR as described in 3GPP TS 36.300 [49]. In UL it is the UE’s responsibility to comply with GBR requirements.

The non-GBR bearer (NGBR) does not support a guaranteed bit rate over the radio link and is thus not suitable for IMS based voice services.
4.3 Bearer Management

4.3.1 EPS Bearer Considerations for SIP Signalling and XCAP

For SIP signalling, the IMS application in the UE must use the IMS well-known APN as defined in PRD IR.88 [67]; the UE must prevent non-IMS applications from using this APN.

Unless preconfigured by the home operator to provide the IMS well-known APN during initial attach, the UE must not provide the IMS well-known APN during the E-UTRAN initial attach procedure.

**Note 1:** The network has to be prepared to receive any APN, including the IMS well-known APN, during the E-UTRAN initial attach procedure, as per 3GPP TS 23.401 [10] and 3GPP TS 24.301 [17].

**Note 2:** When preconfiguring the UE to provide the IMS well-known APN during initial attach, the home operator needs to ensure that the IMS well-known APN is part of the subscription of the user of the UE in order to avoid attach failure. How the home operator preconfigures the UE is out of the scope of this PRD.

If the PDN connection established during the initial attach is to an APN other than the IMS well known APN, then prior to registering with IMS the UE must establish another PDN connection to the IMS well-known APN.

**Note 3:** PDN Connection establishment can be caused by a SIP registration request. Sending a SIP registration request per the note in Section 2.2.1 can cause PDN Connection establishment even if the IMS voice over PS Session indicator indicates that IMS voice over PS session is not supported.

**Note 4:** For all cases when the UE provides the IMS well-known APN, the APN Operator Identifier is not included.

A default bearer must be created when the UE creates the PDN connection to the IMS well-known APN, as defined in 3GPP specifications. A standardised QCI value of five (5) must be used for the default bearer. It is used for IMS SIP signalling.

For XCAP requests, the UE must be preconfigured or provisioned by the home operator with the Network Identifier part of the APN for Home Operator Services to be used for these requests (see GSMA PRD IR.88 [67] for more information).

**Note 5:** How the home operator preconfigures or provisions the UE with the Network Identifier part of the APN for Home Operator Services is out of the scope of this PRD.

4.3.2 EPS Bearer Considerations for Voice

For an IMS session request for a Conversational Voice call (originating and terminating), a dedicated bearer for IMS-based voice must be created utilising interaction with dynamic PCC. The network must initiate the creation of a dedicated bearer to transport the voice media. The dedicated bearer for Conversational Voice must utilise the standardised QCI value of one (1) and have the associated characteristics as specified in 3GPP TS 23.203 [4].
Since the minimum requirement for the UE is the support of one (1) UM bearer which is used for voice (see Section 7.3.1 and Annex B in 3GPP TS 36.331 [52]), the network must not create more than one dedicated bearer for voice media. Therefore, the UE and network must be able to multiplex the media streams from multiple concurrent voice sessions.

**Note 1:** A single bearer is used to multiplex the media streams from multiple concurrent voice sessions; this is necessary in some supplementary services (for example CW, CONF).

**Note 2:** The sharing of a single GBR bearer for voice means that different QCI and/or ARP values are not possible for different voice streams.

When the UE has an ongoing conversational voice call, the UE must follow the procedures for access domain selection related to “Persistent EPS bearer context” as specified in sections 5.5.3.2.4 and 5.5.3.4.3 of Release 10 of 3GPP TS 24.301 [17], sections 5.1.3.1 and L.2A.0 of Release 10 3GPP TS 24.229 [15], and section 8.2 of Release 10 3GPP TS 24.237 [16].

For IMS session termination of a Conversational Voice call, the dedicated bearer must be deleted utilising interaction with dynamic PCC. The network must initiate the deletion of the bearer.

### 4.4 P-CSCF Discovery

The UE and packet core must support the procedures for P-CSCF discovery via EPS. These are described in 3GPP TS 24.229 [15], Annex L.2.2.1 as option II for P-CSCF discovery.

The UE shall indicate P-CSCF IPv6 Address Request and P-CSCF IPv4 Address Request when performing the following procedures (see also section 4.3.1):

- During the initial attach when establishing PDN connection to the default APN,
- During the initial attach when establishing PDN connection to the IMS well-known APN, and
- During the establishment of the PDN connection to the IMS well-known APN when already attached,
- During the attach procedure for emergency bearer services, and
- During the establishment of the PDN connection for emergency bearer services when already attached.

The UE must use the P-CSCF addresses received during PDN connection establishment to the IMS well-known APN when accessing non-emergency services, and must use the P-CSCF addresses received during PDN connection establishment for emergency bearer services when accessing emergency services, as defined in section 5.1 and 3GPP TS 24.229 [15].

If the UE receives a Modify EPS Bearer Context Request message containing a list of P-CSCF addresses that does not include the address of the currently used P-CSCF, the UE must acquire a P-CSCF different from the currently used P-CSCF and initiate a new initial registration as described in Release 12 version of TS 24.229 section L.2.2.1C.

**Note:** The above behavior can result in any ongoing calls being terminated.
5 Common Functionalities

5.1 IP Version

The UE and the network must support both IPv4 and IPv6 for all protocols that are used for the VoIP application: SIP, SDP, RTP, RTCP and XCAP/HTTP. At PS attach, the UE must request the PDN type: IPv4v6, as specified in section 5.3.1.1 in 3GPP TS 23.401 [10]. If both IPv4 and IPv6 addresses are assigned for the UE, the UE must prefer the IPv6 address type when the UE discovers the P-CSCF.

After the UE has discovered the P-CSCF and registered to IMS with a particular IPv4 or IPv6 address, the UE must use this IP address for all SIP communication as long as the IMS registration is valid. For all SDP and RTP/RTCP communication, the UE must use the IPv4 address used for SIP communication or an IPv6 address with the IPv6 prefix same as the IPv6 prefix of the IPv6 address used for SIP communication.

Note: There are certain situations where interworking between IP versions is required. These include, for instance, roaming and interconnect between networks using different IP versions. In those cases, the network needs to provide the interworking in a transparent manner to the UE.

5.2 Emergency Service

5.2.1 General

UEs and network deployments must support emergency services in the IMS domain.

The UE and the network must support the Release 9 IMS emergency services as specified in 3GPP TS 24.229 [15], 3GPP TS 23.167 [3], chapter 6 and Annex H, and Release 9 emergency procedures as specified in 3GPP TS 24.301 [17].

When the UE has an ongoing emergency call, the UE must follow the procedures for access domain selection related to “Persistent EPS bearer context” as specified in sections 5.5.3.2.4 and 5.5.3.4.3 of Release 10 of 3GPP TS 24.301 [17] and section 8.2 of Release 10 3GPP TS 24.237 [16].

Recognizing that some network operators will continue a parallel CS network whilst their IMS network is deployed, and that support of emergency calls with CS support may be a local regulatory requirement, emergency calls in the CS domain are addressed in Annex A.

UEs and networks compliant with this profile must implement support for the 3GPP IM CN subsystem XML body as defined in section 7.6 of 3GPP TS 24.229 [15].

The usage of the 3GPP IM CN subsystem XML body in the network is an operator option.

Note: This implies that the P-CSCF must support also the option that the XML body is not used.

The SUPL enabled UE sends the emergency SUPL messages related to the UE detectable emergency session within the PDN connection for emergency bearer services. The SUPL enabled UE sends the emergency SUPL messages related to the non UE detectable emergency session within the PDN connection to the IMS well known APN. The UE selects
the bearer to be used based on the TFTs of the bearers of the PDN connection. QCI of the selected bearer is provided by the network.

5.2.2 Interactions between supplementary services and PSAP callback
The network shall not invoke the use of supplementary services on a call identified as a PSAP callback as specified in the Release 12 versions of 3GPP TS 24.604 [20], 3GPP TS 24.605 [21], 3GPP TS 24.610 [25] and 3GPP TS 24.611 [26].

Note: UE procedures for PSAP callback are not specified by 3GPP.

5.3 Roaming Considerations
This profile has been designed to support IMS roaming with both P-CSCF and PGW in the visited network. For more information on this roaming model see GSMA PRD IR.65 [65] and GSMA PRD IR.88 [67]. Other roaming models are out of the scope of this profile.

5.4 Accesses in addition to E-UTRAN
UEs that support cellular (e.g. E-UTRAN) and non-cellular accesses that are not EPC-integrated (e.g. non-EPC integrated Wi-Fi access) must use:

- the cellular access as transport of the Gm reference point; and
- the cellular access as transport of the Ut reference point, unless preconfigured by the home operator.

5.5 Data Off and Services Availability

5.5.1 General
When Data Off is activated, the UE must not send via any PDN connection any uplink IP packet of any service other than Data Off Enabled Services.

Data Off Enabled Services defined in the present document are specified in the following sub-sections.

Note: The UE can disconnect PDN connections that are not required by Data Off Enabled Services.

5.5.2 Supplementary Service Settings Management
The UE must be able to perform supplementary service settings management as described in section 2.3 regardless of whether the Data Off is activated.

Unless transport of the uplink IP packets via PDN connection for the APN for Home Operator Services in 3GPP access is already enabled, the UE shall temporarily enable transport of the uplink IP packets via PDN connection for the APN for Home Operator Services (see section 4.3.1) for the period required to complete the supplementary service management procedure (e.g. for the period required to complete changing of a Communication Forwarding setting). During that period, the UE must not send via the PDN connection for the APN for Home Operator Services any uplink IP packet of any service other than:

- the supplementary service settings management as described in section 2.3; and
- any other Data Off Enabled Services.
5.5.3 Voice Calls and SMS over IMS

The UE must be able to initiate and receive Voice Calls and SMS over IMS as described in the main body of this document regardless whether the Data Off is activated, i.e. the UE continues to use (does not disconnect) the PDN connection via the IMS well-known APN as described in section 4.3.
Annex A  Complementing IMS with CS

A.1 General
In order to offer its customers a seamless service, the operator may wish to complement the IMS VoIP and SMSoIP capable radio coverage by utilising the CS radio access for voice and/or the CS core network for SMS over SGs. The IMS VoIP and SMSoIP coverage may be less or more extensive than the concurrent Circuit Switched (CS) coverage. This Annex describes the additional features that need to be implemented for the UEs and networks that wish to support such a deployment scenario.

The voice related requirements in this annex are applicable if the UE has the setting of “IMS PS Voice preferred, CS Voice as secondary”.

A.2 Domain Selection
The network and the UE must support the IMS voice over PS session supported indication as specified in 3GPP TS 23.401 [10] (section 4.3.5.8) in 3GPP Release 8.

An UE must perform voice domain selection for originating sessions with the setting of “IMS PS Voice preferred, CS Voice as secondary” as specified in 3GPP TS 23.221 [6], Section 7.2a and must perform the procedures in 3GPP TS 24.301 [10].

Note 1: The behaviour of UEs with the setting “IMS PS Voice preferred, CS Voice as secondary” is illustrated in 3GPP TS 23.221 [6], Annex A.2.

An UE must reject the incoming request if the UE is unable to support speech media on current PS access as specified in 3GPP TS 23.237 [8] and 3GPP TS 24.237 [16].

An UE must support Idle Mode Signalling Reduction (ISR) as specified in Release 9 specifications 3GPP TS 23.401 [10] and 3GPP TS 24.301 [17].

A.3 SR-VCC
The network must support the Single Radio Voice Call Continuity (SR-VCC) procedures for handover from E-UTRAN as described in 3GPP TS 23.216 [5] and 3GPP TS 23.237 [8].

The UE must support the SR-VCC procedures for single active call only as described in 3GPP TS 23.216 [5], 3GPP TS 24.008 [11], 3GPP TS 24.237 [16], and 3GPP TS 24.301 [17].

Note 1: The mechanisms to perform transfer of additional session / held state / conference call state / alerting calls are out of scope of the present version of this profile.

Note 2: UEs using IMS Centralized Services (ICS) capabilities are out of scope of the present version of this profile.

A.4 IMS Voice service settings management when using CS access
The UE must use service setting management as defined in Section 2.3.2 and Section 5.5.1 using the current cellular access, over the APN defined in section 4.3.1. UEs that support
non-cellular accesses that are not EPC-integrated (e.g. non-EPC integrated Wi-Fi access), must comply to the requirements of section 5.4.

**Note 1:** This applies also when UE is using CS network for voice service.

If:

- the UE attempts to perform supplementary service settings management via XCAP;
- the UE receives an HTTP failure code as described in sub clause 5.3.1.2.2 in the Release 12 version of 3GPP TS 24.623 [28];
- the UE is not configured with network operator's preference for the selection of the domain used by the UE when performing supplementary services setting control for voice services; and
- until the UE performs a power-off/power-on or the UE detects a change of USIM/ISIM

then:

- the UE shall not perform supplementary service settings management via XCAP; and
- the UE shall instead attempt to perform supplementary service settings management in the CS domain.

**Note 2:** By default, the UE is not configured with the network operator's preference for the selection of the domain used by the UE when performing supplementary service settings control for voice services.

### A.5 Emergency Service

This section modifies the requirements defined in section 5.2 in the following ways:

The UE must, and the network can, support the procedures and capabilities defined in section 5.2.

If the support of one or more of the following scenarios is required, then the network must support the procedures in section 5.2:

- Deployment scenarios where the IMS VoIP capable radio coverage is not complemented by CS radio coverage.
- Provide voice service on LTE to UE with incompatible CS domain.
- Provide voice service on LTE to UE supporting LTE only

When emergency service support via CS domain is required, the UE and network must support the CS emergency service as used today.

The UE must be able to perform domain selection for emergency calls, and automatically be able to retry in the other domain if an emergency session attempt fails, as defined in 3GPP TS 23.167 [3] chapter 7.3 and 3GPP TS 24.229 [15]. The UE must be able to detect if the network is not supporting IMS emergency sessions as defined in 3GPP TS 23.401 [10], then select the CS domain for UE detected emergency sessions.

The network must be able to reject an IMS emergency session attempt such that the UE can retry in the CS domain, as defined in 3GPP TS 24.229 [15] and 3GPP TS 23.167 [3], chapter 6.2.1.
When IMS emergency service is not possible (for example, the network does not support IMS emergency), and when the UE supporting CS Fallback (CSFB), as described in 3GPP TS 23.272 [9], is IMSI attached, and emergency services are supported in the CS domain, the UE must use the CSFB procedures for CS emergency service. If the network or the UE does not support CSFB, the UE must autonomously select the RAT which supports CS emergency service.

The network must support SR-VCC for IMS emergency sessions as specified in 3GPP Release 9 TS 23.216 [5] and 3GPP TS 23.237 [8]. The network must support the SIP instance ID as described in 3GPP TS 24.237 [16].

In limited service state, it is recommended that a UE that is CS voice capable should always camp on a RAT which is likely to support the CS domain, for example, GERAN or UTRAN or CDMA2000, as described in 3GPP TS 23.221 [6].

A.6 Roaming Considerations

Section 5.3 defines the preferred roaming model, but this model may not always be possible, due to the IMS roaming restrictions or lack of P-CSCF in the visited network. When voice over IMS is not possible the UE must follow procedures defined in Annex section A.2 to use CS for voice service.

A.7 SMS Support

This section modifies the requirements defined in section 2.5 in the following ways:

The UE must, and network can, support the SMS-over-IP as described in section 2.5. In addition, when support of SMS over SGs is required, the UE and network must support the necessary procedures as specified in 3GPP TS 23.272 [9], 3GPP TS 23.221 [6] and 3GPP TS 24.301 [17]. If the UE supports both SMS-over-IP and SMS over SGs methods, the UE must support functionality as specified according to section 7.2c in 3GPP TS 23.221 [6]. The UE must:

a) Be pre-configured by the operator to use either SMS over IP or SMS over SGs;
b) Be capable of being configured according to IMS Management Object defined in 3GPP TS 24.167 [68] parameter “SMS_Over_IP_Networks_Indication”, in order to give operator control to configure UE to use SMS over SGs when required.

If SMS over SGs is not supported then the network must support the procedures in section 2.5.

A.8 Call Waiting in the CS domain

When the UE on an ongoing call is presented with a new incoming call from the CS core network and:
if the Communication Waiting supplementary service (see section 2.3.4) is deactivation in the UE, the UE must reject the incoming call by sending a RELEASE COMPLETE message with cause #17 "user busy" as specified in 3GPP TS 24.008 [11]; and

if the Communication Waiting supplementary service is activated in the UE, the UE must generate a call waiting indication to the user.

A.9 USSD

For a UE that supports CSFB:

If the UE has no ongoing IMS session for conversational voice calls and is not in the process of establishing an IMS session for conversational voice call (originated or terminated) then the UE must use the CSFB procedures as described in 3GPP TS 23.272 [9] for originating and terminating USSD requests in the CS domain.

If the UE has one or more ongoing IMS sessions for conversational voice call or is in the process of establishing an IMS session for conversational voice call (originated or terminated) then:

- the UE must not attempt an originating USSD requests in the CS domain; and
- if paging procedure takes place, the UE must reject the request to perform CS fallback for terminating USSD requests as specified in 3GPP TS 24.301 [17].
Annex B  Features needed in certain regions

B.1  General
This annex describes features that operators need to support in certain regions due to local regulatory requirements.

B.2  Global Text Telephony
In some regions, there are regulatory requirements that deaf/hearing impaired people must be able to perform text based communication to other users and government offices. In this document, this service is referred to as Global Text Telephony and the following requirements outlines how the Global Text Telephony service should be implemented in regions where required.

Global Text Telephony/teletypewriter messages must use ITU-T Recommendation T.140 [70] real-time text according to the rules and procedures specified in 3GPP TS 26.114 [35] with the following clarifications:

- The UE must offer AVP for all media streams containing real-time text.
- For real-time text, RTCP reporting must be turned off by setting the SDP bandwidth modifiers “RS” and “RR” to zero.
- The sampling time used must be 300 ms.
- Change of the sampling time (rate adaptation) is not required.

B.3  Service Specific Access Control
In some regions, for example Japan, there are regulatory requirements that require the need to stop only voice calls while allowing high priority calls and access for other packet (for example email, web, disaster message board) services, as under disaster or emergency events, the mass simultaneous voice call requests are usually the main cause for network congestion.

To fulfill the regulatory requirements, the UE for such regions must support Service Specific Access Control (SSAC) as specified in Release 9 version of 3GPP TS 22.011 [1], 3GPP TS 36.331 [52], 3GPP TS 24.173 [14] and 3GPP TS 27.007 [43].
