Risk Communication Guide for Mobile Phones and Base Stations

Practical guidance and support on good risk communications practice for the mobile industry
Acknowledgements

This guide was produced for the GSMA by Professor Ray Kemp of Ray Kemp Consulting Limited in consultation with Dr Jack Rowley of the GSMA, Michael Milligan of the MWF and their respective members.

The guidance is not compulsory and does not replace existing national regulatory requirements or industry practices. Effective risk communication practices take account of the prevailing social, political and administrative traditions and regulatory frameworks in a country.

1. Introduction and background

Mobile phones and other wireless technologies have become an integral part of everyday life.

How do mobile phones work?

While many people recognise the personal benefits of mobile services, local officials and the public may have concerns about possible risks from the radio signals used by antenna sites and mobile devices. These concerns may lead to delays in acquiring new antenna sites, to negative media stories and pressure on politicians to adopt further restrictions.

Research in several countries shows that a significant percentage of the population has a poor understanding of the need for antenna sites, the operation of mobile phones and how levels of radio signals are regulated and controlled.

Many mobile phone users do not understand the need for a network of nearby antennas.

Recognising the importance of effective communication, in 2002 the Electromagnetic Field (EMF) Project of the World Health Organization (WHO) produced a booklet on risk communication that contains the following definition:

**RISK COMMUNICATION:**
An interactive process of exchange of information and opinion among individuals, groups and institutions. It involves multiple messages about the nature of risk and other messages, not strictly about risks, that express concerns, opinions, or reactions to risk messages, or to legal and institutional arrangements for risk management.
Risk communication is more effective when there is cooperation within the mobile industry and where trusted scientists and public officials are involved. It is important that people working in the mobile industry improve their understanding of why people may be concerned and develop skills to respond to those concerns through consideration, anticipation and effective management.

The Objective

This document aims to provide practical guidance and support on good risk communication practice for people working in the mobile industry, especially those who are facing public concerns about radio signals. While it does not address social or other issues around mobile telecommunications many of the communication principles will still apply.

This document aims to improve understanding of:

1. Why and how people perceive radio signals the way they do.
2. Effective ways of addressing perceived risks of radio signals – the who, what, when and how of risk communication.
4. Options for responding to perceived risks of radio signals.

The emphasis is on anticipating where people may have concerns and then using effective communication approaches to minimise the potential for heightened concerns in the community.

It is important to distinguish between hazard and risk. A hazard is a set of circumstances that could potentially harm a person’s health. Risk is the likelihood, or probability, that a person will be harmed by a particular hazard. For example: driving a car is a potential health hazard. Driving a car faster presents an increased risk. It is possible to reduce risks but there is no such thing as a zero risk.

In explanations never compare a voluntary risk (such as driving) to an involuntary risk.

Additional information on related science, technology and policy topics may be found at: www.gsma.com and www.emfhealth.info
2. Risk and Risk Perception Factors: Why are People Concerned?

Communication about the location of base station antennas or use of mobile phones is often characterised by high levels of concern about the subject and very little trust in those promoting the technology.

**Risk communication skills are needed where concern is high and the level of trust is low.**

Effective risk communication aims to promote understanding of the proposals and of the importance and benefits of mobile communications.

The essential goal is also to establish your organisation as a source of information that can be relied upon and to show that your organisation takes the concerns of individuals seriously and treats all people with respect. A secondary goal is to inform and educate.

**The primary objective of effective risk communication is to establish a good working relationship with stakeholders.**

**The secondary objective is to convey information.**

It is tempting to believe that education of the public will make concerns go away. However, conflicts are often due to a clash of values or interests, rather than a lack of understanding. The facts are important but so also is the process of communicating the facts.

A level of trust must be established **before** trying to communicate with those who are concerned about the proposals. People will not accept information from someone they do not trust.

It is also likely that your organisation will be more trusted to explain the technology than to comment on scientific research.

Trust is not something that can be expected or demanded. It may take a great deal of time and effort to establish and it can be quickly damaged by a small mistake or instance of poor judgement.

**Trust is hard to earn and easy to lose**

Remember that just presenting facts will never be persuasive for some people. This is because there have been many false claims by officials, scientists and even regulators in the past over a wide range of environment and health issues.

**People tend to place more weight on information that confirms their existing views.**

People now have access to a wide range of alternative views and sources of information to support their own interpretations. Not all of this information is equally accurate but people may find it difficult to judge the reliability of claims about scientific research.

A key test is whether scientists’ research results can be replicated (reproduced by other scientists).
Research that is well conducted usually goes on to be published in a peer-reviewed scientific journal. Unfortunately the quality of peer review is not uniform and publication alone is not always a guarantee of quality.

Understand people’s perceptions of risks because this is their reality.

People’s behaviour depends upon opinions, emotions and perceptions about possible risks. These are formed by what people read, see and experience. Age, gender, cultural background, family and education all influence risk perceptions.

Precautionary recommendations are likely to increase concern.

The process of communicating about radio signals may increase concern because the public may not have considered the issues previously. When this is linked to precautionary messages, such as how to reduce exposures, it may be interpreted as confirming the possibility of a risk.

The WHO warns against precautionary measures such as arbitrary reductions of safety limits as this may undermine confidence in their scientific base.

The consequences of such arbitrary limits can include the need for more base stations in order to establish an effective network, with associated potential for network deployment delays and increased costs.

When faced with calls for precaution, point out the protective exposure standards with large safety margins, the technical features that minimise unnecessary exposures, the ongoing research and the availability of consumer information as existing precautionary measures.

In addition, as mobile telecommunications systems are an international technology. It is always preferable to follow international standards. If local safety standards are to differ from internationally published guidance, then it is important that there is a sound justification for doing so.
3. Perceptions About Mobile Phones

People may have read claims that there might be risks from long-term mobile phone use or that some people are more sensitive to radio signals. Mobile phone users may attribute their own symptoms to their mobile phone use. Parents may recognise the personal safety benefits for their children and also be concerned about possible health risks. See also Appendix 1 on the IARC classification of RF-EMF.

Many people do not understand how a mobile phone works. They do not understand that the phone transmits and receives radio signals and that the phone uses less power when the network connection is good, such as nearer to an antenna site.

Mobile phones are tested at the highest certified power level in laboratory conditions, however, the power is adjusted during a real call to operate at the lowest possible level.

Importantly, the international safety guidelines are designed to be protective of all persons, including children and pregnant women, against all established health hazards.

The WHO has concluded that while self-reported headaches and other symptoms were real, there was no scientific basis to link the symptoms to exposure to radio signals. Furthermore, the WHO says that treatment should focus on medical management of the health symptoms and not on reducing exposure to radio signals.

People can choose to reduce their exposure to mobilephone radio signals.

It is important to recognise that with mobile phones there is generally choice about usage. If users are concerned they can reduce exposure by using a handsfree kit or limiting the length of calls.

Key Communication Points – Phones

- A phone is a low power radio transmitter and in good coverage operates at a similar level to a home cordless phone.
- Mobile phones are tested for compliance at maximum power and international exposure guidelines are designed to be protective of all persons.
- If users are concerned they can reduce their exposure by using a handsfree kit or limit the length of calls.
4. Perceptions About Antenna Sites

People’s perceptions about antenna sites or radio base stations are quite different to their perceptions of mobile phones. This is because possible risks due to the radio signals from antenna sites score highly on many of the perception characteristics or so-called dread factors that can cause heightened public concern.

What is a base station?

Radio signals are not x-rays. The only established effects are related to heating from very high-level exposures. More than 50 years of research on radio signals, using the same methods that show health risks from other agents, has found no scientifically established long-term health hazards from low-level exposures to radio signals.

Note that very few of the these perception characteristics relate exclusively to the science of radio signals and health. The most important dread factors are discussed below.

Low trust in those in authority.

The public may feel let down by past experiences of trusting government or industry, and often refer to examples such as tobacco and asbestos.

However, there are international safety recommendations, the mobile industry is subject to regulation and the WHO states that there are no established health risks from low-level radio signals.

Fear of both chronic and catastrophic effects on health.

Some people are concerned that there may be unknown long-term health effects. People may also liken radio signals to nuclear radiation and fear incurable serious illness.

Radio signals are not understood.

Exposure to radio signals can not be perceived, it is unseen and unheard. Radio signals may be perceived as new and unfamiliar. When people don’t understand how something works they will often assume the worst.

Typical levels from base stations in publicly accessible areas are 50 to 50,000 times below international safety recommendations. This is lower than or comparable to radio and television broadcast services, which have been in operation for the past 50 or more years without any adverse health consequence being established.

Risks appear to be scientifically uncertain and scientists appear to disagree.

When scientists argue it becomes difficult for the public to know who to turn to for reassurance. Openness is a key first step to establish trust, so acknowledge uncertainty and differing interpretations, explain why they exist and place them in the context of what is already known.

It is advisable to refer people to independent official sources of information such as national regulators, health authorities and the EMF Project of the WHO. Emphasise that the mobile industry is not a health authority and is guided by the conclusions of independent health authorities.
There is no personal control over exposure once the site is operating.

People will accept risk in their lives, but most people want to be able to have some level of control over it. Local residents may want to have a say where an antenna site is built. At least they wish to know that their concerns have been acknowledged.

Ensure that your communications show people that their concerns have been heard. Explain what has been done in response and what can or cannot be changed and why.

Once people become used to a base station in their neighbourhood they might cease to worry about it. Effective risk communication is decisive in supporting this process.

Children are perceived to be particularly at risk.

People have a natural instinct to protect children. Parents may perceive that the health of children is threatened when antennas are placed near homes or schools. There is no scientific reason to avoid locating antennas on or near schools. In fact exposures in the school may be lower when antennas are placed on school buildings because the signals are directed outwards not downwards. However, given the potential for a negative reaction it may be useful to consult with school representatives before a formal application is made.

Specific households and communities are affected with few clear benefits.

In addition to fears about radio signals, people may worry about effects on property prices and the appearance of the antennas. There may be a sense of injustice that sometimes creates real anger because affected people may feel their own interests are being overlooked for others’ benefit. People may also object because a neighbour is benefiting from the antenna site rental rather than their own property.

It is important to help people to understand the need for antenna sites and to explain the improved coverage of having antennas near to where people live and work.

Media attention, human interest stories make good copy.

Local media will generally heighten or amplify concerns about an issue by reporting stories in a sensationalist way. Local communities trying to obstruct the power of a national company make an interesting story.

It is important to work positively with the media to show them the real community benefits that come from improved mobile telecommunications and provide them with independent expert sources so they do not have to rely on the information provided by protestors or critics. Respect the deadlines of reporters and the need for differing types of materials by different media outlets (press, radio, TV).

As an example, it may be possible to work with the media by placing ‘advertorials’ in local newspapers that give a more positive explanation of the proposals than would otherwise be presented.

Key Communication Points – Antenna Sites

- Typical exposures from antenna sites are less than 1% of international safety recommendations. These levels are broadly comparable to radio and television broadcast services that people already accept.

- The WHO states that considering the very low exposure levels and research results collected to date, there is no convincing scientific evidence that the weak radio signals from base stations cause adverse health effects.

- Radio signals have been in use for more than 100 years and studies of high powered broadcast transmitters have uncovered no increased health risk for nearby communities.
5. Effective Risk Communication

This section considers how to achieve effective risk communication to improve the nature and focus of community consultation in the site deployment process.

In particular, effective risk communication emphasises the need to:

1. Build a working relationship as a trustworthy and reliable party.
2. Improve transparency to make the issues seem less frightening.
3. Provide stakeholders with trusted sources for information or get such third parties involved.
4. Emphasise the benefits associated with improved mobile communications.
5. Find ways of providing people with a sense of involvement in the project, however small, to reduce their sense of powerlessness.

Key Steps in Applying Effective Risk Communication

Step 1
Consider the Issues
- How important is the site?
- Are there sensitive local siting issues?
- Are there any other local community concerns?

Step 2
Identify your audiences
- Who is directly affected?
- Who else will take an interest: the media; politicians; regulators?

Step 3
Consider the Issues
- Do they understand the need?
- Do they have concerns about alleged health issues?
- Is the site intrusive?

Step 4
Develop a communications approach and methods
Employ communications methods based on
- Notification;
- Consultation; or
- Dialogue

Step 5
Apply good practice risk communication methods
Follow the 10 Golden Rules
1. Choose Words Carefully
2. Use Three Key Messages
3. Guarantee Compliance
4. Use Simple Language
5. Empathise
6. Use Pictures
7. Listen Actively
8. Timing
9. Consider Appearances
10. Be Careful about Talking to Larger Groups

Step 6
Consider the Issues and Respond
- Are the proposals: – acceptable; or – in need of amendment?
- Keep people informed of the outcome
**Explain the facts clearly.**

It is important to be honest about the facts, to explain them as clearly as possible without jargon and to demonstrate that every step is being taken in compliance with safety recommendations.

When discussing safety recommendations, explain how they were developed, what they covered and how compliance is assured. This will help people to put the proposals into perspective.

A picture speaks a thousand words so use diagrams and pictures as much as possible.

**Understand public perceptions and anticipate community responses.**

It is not possible to predict accurately how people will respond to an issue every time. However, improved understanding of what motivates public reactions makes it more likely that potential issues are anticipated with responses planned and initiated before an issue becomes a crisis.

**Increase effectiveness by involving affected groups but avoid false expectations.**

Development and operations can be severely hampered and delayed as a result of local protests about a new site construction.

For sites where opposition is anticipated, it may be possible to give people or their representatives an opportunity to contribute to the decision making process. In many cases such participation will be determined by national regulatory procedures.

**It is very important not to create false expectations.**

It should always be clear that participation does not mean a veto or guarantee that there will always be a mutually acceptable solution.

Dialogue can also reduce the amount of media attention as industry and affected stakeholders are seen to seek a better understanding of the position of others.

Do not retreat from dialogue because you fear opposition as refusing to engage in a dialogue will make people think that there is something to hide.

**If people do not perceive you as trusted and credible, then there is little chance that they will accept the information that you provide.**

You need to think about likely questions in advance and provide good answers. People will have more faith in someone who is prepared to respond to specific issues.

If you don’t know an answer don’t speculate. Instead, commit to providing an answer by a specified time and deliver on the commitment.

People use four factors when deciding if you are a trusted and credible source:

1. Are you seen to be responsive to their concerns?
2. Does what you say and how you say it make sense to people?
3. Do they think you are professionally competent?
4. Are you seen to be honest and truthful when dealing with people?

Short-term judgments are based largely on verbal and nonverbal communications. Long-term judgments are influenced by actions and performance. Once judgments are made they are difficult to change.

In high-concern, low-trust situations, you need to be as perfect a communicator as humanly possible. This requires preparation, practice and training. This will ensure that your own reputation and that of your organisation remain intact.

**Improve dialogue and reduce tension.**

By giving people the opportunity to express their opinions, and feel that their voice is being heard tension will be reduced. It can also help to minimise misunderstandings.
6. Developing a Risk Communication Process

This section provides an overview of the main issues that need to be addressed during roll-out of a network in order to ensure that public and stakeholder concerns are identified in advance and addressed efficiently.

This draws upon a number of national approaches that have been applied in the mobile telecommunications sector. Specific approaches need to be adapted to national legal, regulatory and societal frameworks. See also Appendix 3 that provides additional guidance for developing countries.

A national approach consistently applied by all mobile network providers may be helpful to reduce public concern. Communities do not care who may or may not be at fault, real or perceived mistakes by one company will affect other sites.

1. Site Assessment to Understand Local Conditions

It is not possible to give every site the same level of attention. However, practical experience will show that some locations are more likely to generate local opposition.

A good understanding of community concerns allows potential issues to be addressed early in the deployment process to prioritise communications and avoid crises.

In advance, the following questions should be considered to assess a site:

- What are the local community issues? Are there any important social or environmental factors at work? Include all information you have easily available, from site visits, stakeholder input, media records and local authorities.
- Who are the key stakeholders? Identify those individuals or organisations who stand to be affected by the proposal or who could affect the outcome.
- What is the best approach based on these factors? Use a combination of consultation tools and techniques which best fit the issues and the stakeholder profile.

A standardised approach to site assessment can ensure that local communities and other stakeholders are treated in a consistent manner. It also emphasises from the outset the importance of community concerns and public perceptions.

However, this does not necessarily mean adopting a mechanistic approach (where say classification B = action x, y and z). The factors influencing the development of concern and protest are complex so it is important to be flexible and ensure effective risk communication when concerns arise.
2. Anticipating Risk Perception

It is generally much more effective to address concerns early in the deployment process rather than later when views may have become entrenched.

Anticipating Risk Perceptions

While it may seem that concern about possible health issues are the key concern, it is also helpful to pay strong attention to the visual appearance and local amenity issues associated with antenna sites. Objections on health grounds are often a way of formalising ‘Not In My Back Yard’ (NIMBY) objections to visual intrusion and feared loss of property values.

There are many factors that influence the price paid for a specific property and it is difficult to separate possible effects of nearby antenna sites. Many antennas are painted or positioned to visually blend with the environment.

Good visual design that reduces the visual impact of antennas is generally worthwhile and is likely to improve community acceptance.

However, be aware that suggestions of hiding antenna sites may contribute to alarm. In some cases, careful site design may trigger accusations that a danger is being hidden.

Health issues may be a mask for other concerns.

It is much easier to help people to form opinions than to change opinions.

Proactive rather than reactive communication shows that you are acting responsibly, that you want to establish a relationship and demonstrates your commitment to understanding community concerns.
3. Choosing a Risk Communication Technique

There are many risk communication techniques that can be applied to a particular situation. The techniques can be grouped in three broad approaches:

**Notification** for the majority of sites may be limited to the landowner, the local authority, affected public utilities and others as required by national regulations. It is helpful if notification can be standardised both within and between network operators as this is less confusing to potential landlords and local authorities.

Notification by poster or letter might be an appropriate means in some locations. This is basic information provision, a one-way communication approach.

**Consultation** might be sensible for locations with the potential for opposition, such as community facilities, locations with high amenity value or for sites with potentially high perceived impact. This could mean a longer period of notification, allowing time to resolve any issues with landowners and neighbours through more careful design, location choice and perhaps timing of works.

Consultation by letter, telephone or a meeting could be appropriate measures for sites where some opposition is expected either regarding planning and environmental issues or community concern. This is two-way information exchange between operator and key stakeholders.

**Dialogue** might be necessary for environmentally sensitive areas or locations with complex concerns such as schools or hospitals or where protests have occurred previously. Prior discussions can be undertaken with land owners, neighbours, local authorities and other stakeholders to develop agreements in advance of deployment. This will require a longer lead time to reduce or remove potential delays to deployment.

Dialogue should be considered for sites where community concerns are anticipated to run high or have the potential to do so. This is a planned communication process aimed at building trust and avoiding large-scale public events and media campaigns.

This is a multiple exchange of information between operator and all stakeholders.

**Issue Lifecycle**

It is good risk management to anticipate and address community concerns. As seen in the diagram of concerns, early risk management is better than crisis management of outraged communities who feel they have not been consulted with fairly.

**Early intervention can minimise delay due to public concern.**

In respect of a specific situation and the level of potential concern, a combination of different risk communication measures and approaches might be helpful.

**Appendix 2 summarises advantages and disadvantages of different risk communication approaches for a range of stakeholder groups.**
7. Guidance on Risk Communication in Practice

The three underlying practicalities to address in risk communication are:

1. **What information is being communicated** (The Message).
2. **Who is delivering the information** (The Messenger).
3. **How the information is being communicated** (The Means).

**The Message:** the message should always be simple and concise. It could comprise a statement backed up with supporting evidence or third party authorisation and should lead the audience to a conclusion.

**The Messenger:** Continuity in the relationship is of key importance and a local contact person is preferable to someone from ‘the headquarters’. Ideally the same representative would be available throughout all contact with a particular community or group of interested stakeholders. This makes it easier for a relationship to develop and to be maintained.

As the messenger, you should pay attention to body language, both in terms of observing local customs and how you present yourself.

As with the message it might be helpful to involve trusted third parties who have a higher credibility. Consider the possibility of coordinated communications and alliances with credible university scientists, doctors, citizen advisory groups, trusted local officials, and national or local opinion leaders.

**The Means:** Think about the most appropriate way to communicate with your audience. This should be based on who your stakeholders are, an assessment of their needs and the type of proposal under consideration.

Different communications approaches will suit different situations, but general principles to consider include the following:

- keep the communication short and concise.
- make positive statements.
- avoid using technical or industry jargon.
- be responsive to the concerns of the audience and listen carefully.

Use leaflets, hand outs, diagrams or posters with good visual detail as much as possible. Heightened public concerns are best addressed in smaller scale interactions supported by a toolkit of accessible information materials rather than large open public meetings.
Identifying and understanding stakeholders

The key to effective risk communication is to know your audience.

What do we mean by stakeholders?
Stakeholders are those individuals or organisations who are likely to experience an impact (directly or indirectly) as a result of the proposed activity. Stakeholders are also those people who are able to influence whether or not a proposal will proceed.

For consultation activities to be as effective as possible, it is important to ensure that the most appropriate stakeholders are included in the process.

How do we identify these individuals or groups?
To identify key stakeholders start by looking at the widest possible range of interested parties. This can include those with professional or technical expertise, financially involved parties and those with local and community knowledge. The affected communities may not be restricted to the immediate vicinity of the site. For example, parents bringing their children to a nearby school or a group of non-resident users of a local park or conservation area. Key people in this process are:

- The decision makers, for example, local officials, leaders or politicians.
- Those people directly affected by the decision, for example, local residents.
- Relevant interest groups, for example, activist groups, conservation bodies.

Twelve Questions to consider in determining the key stakeholders:

1. Who lives close to the proposed development?
2. Who are the local officials?
3. Who lives in a home from which the structure might be visible, this includes gardens?
4. Who works nearby?
5. Are any schools, colleges, or kindergarten facilities in the vicinity?
6. Are there any religious or sacred buildings nearby?
7. Are care or residential facilities for children or the elderly in the area?
8. Are there any landmarks or local cultural features nearby from which the proposed structure would be visible?
9. Are there existing community groups in the area who could be involved in the consultation process?
10. Has there been recent experience of poorly managed development locally, maybe action groups or local media are key stakeholders?
11. Are there nature or leisure parks and playgrounds nearby, who uses them?
12. Are the local properties lived in by owner occupiers or tenants? Remote landlords may need to be considered, particularly in holiday areas.
What are the likely concerns of stakeholders? What are their needs and interests?

It is important to address stakeholder concerns and to understand their needs before and during consultation. For example, they may be unwilling to meet your timescales for decisions. They may need more time to address the issues, if the information is very novel to them or if they find it difficult accessing the information, possibly due to language barriers.

You cannot expect stakeholders to understand, let alone accept, your network needs if you are not prepared to understand, acknowledge and address their needs.

Stakeholders may have any number of motivating factors, including protection of the work or home environment, health concerns, financial loss (or gain), political promotion, implementation of local or national regulations, duty to represent the wider community, delivery of project milestones to target or fear of the unknown.

Some might also use the health issue to disguise their real interests. However, not dealing seriously with them might make you suspect in the eyes of those who are honestly concerned, so it is most effective to acknowledge people’s concerns and address them at face value.

Understanding these values takes effort and requires listening, responsiveness and dialogue on an ongoing basis. The better you understand your stakeholders’ values and motivations, the better you will be able to address their concerns and find a way forward.
There is a small group of key concepts that can be learnt and practised to improve your ability to communicate effectively in high-concern, low-trust situations.

Risk communication is dynamic and should adjust to the audience and the issue lifecycle.

It is important to respond quickly to concerns even if the complete answer is not available. Provide information as early as possible and follow with updates as they become available.

Preparation is key to being able to respond quickly; it includes well-designed and tested materials, nominated spokespersons and company procedures to authorise statements as an issue develops.

1. Choose Words Carefully

Use clear, non-technical language that aims for understanding and knowledge building. Make sure that you understand the information needs of your audience. Be careful not to sound or be condescending. Personalise your communications to show openness and build trust.

Comparisons can be used to make facts more understandable but should not be used to gain acceptance or trust.

For example, compare levels either before and after the antennas are installed or with safety recommendations but note that some people may be concerned about levels below the recommendations. It is best to pre-test comparisons to ensure that they deliver the intended response and don’t generate more questions than answers.

Listen carefully to what is being said and pay close attention to body language. Be aware of your emotions and those of your audience.

2. Use Three Key Messages

In high-concern circumstances people may feel threatened and this disrupts their ability to process information. It is recommended that no more than three key messages are provided during communications with highly concerned parties. Too much information may confuse and irritate.

To make that information count, you should ensure that your primary messages are clear, concise, provided early and repeated for emphasis. If you provide more than three key messages you run the risk of the most important issue being forgotten.

8. Ten Golden Rules for Effective Risk Communication

Getting Across Your Key Messages • It helps to address people’s perceptions if you:

1. Make the issue visible to people. Show diagrams of the proposal. Show comparisons of the levels of radio signals before and after installation.

2. Point out the benefits. Tell people about improvements to service but do not try to ‘sell’ the technology to the community.

3. Give people a sense of involvement. Local communities may have advice on improving the design or location of the antennas that could be accommodated.
3. Guarantee Compliance

Remember that you are not a health expert. People will ask you for a guarantee that there is no risk from exposure to radio signals. There is no such thing as ‘zero risk’ and absolute safety cannot be proven. So it is unreasonable for people to ask you for a health guarantee. However, you can guarantee that the site and equipment will be built and operated to meet all relevant safety recommendations. Any changes to those recommendations will also be met.

Example: Health  We always put the health of the public, and our employees before all else.

- We comply with the national safety requirements.
- The scientific research to date shows that operated within the safety recommendations this technology is regarded as safe for all individuals.
- We understand that you may be worried about this, so we will provide independent assessment of the levels of radio signals before and after the antenna becomes operational.

This key message technique applies to all types of communication: conversations, presentations, fact sheets, brochures, display materials and videos.

Your key messages can be supported by other forms of communication materials, which would either re-emphasise the same key point or provide independent verification.

For example, the message ‘We always put the health of the public, our customers, and our employees before all else’ could be supported with the relevant WHO fact sheets.

4. Use Simple Language

Try to keep the amount of technical terminology, industry jargon and abbreviations to a minimum. Using unfamiliar terms for your audience can alienate them whereas making the effort to carefully explain what you mean and checking that everyone understands what you are saying will help to establish you as trustworthy and credible.

Acknowledge that you are simplifying and provide references to supporting documents. Do not oversimplify, as you may seem to be ill informed or hiding the truth.

5. Empathise

Express yourself as caring about people’s concerns. Remember that people won’t care what you know and what you want to tell them until they know that you care.

So demonstrate that you care by telling people that you do. For example: ‘I understand that you could be worried by some of the reports about living near antenna sites.’

6. A Picture is Worth a Thousand Words

People are able to retain more information through the provision of illustrative materials. Visual documents can help people to understand the various sources of radio signals in the environment or imagine how a proposal might look and can improve understanding of what is being considered.

It is important to ensure that people understand the images in the way that you intend. Ideally they should be tested with target audiences before use. Ask questions to ensure that the information is understood.

7. Listen Actively

People are often more concerned about issues such as trust, credibility, control, benefits, competence, fairness, empathy and courtesy than about quantitative risk assessment. If people feel that they are not being heard, they cannot be expected to listen.

Provide people with plenty of time to tell you what they think. Ask questions and don’t interrupt or try to give them a response until they have had time to get everything off their chest.

Demonstrate that you are listening with your body language and by writing down notes.

8. Timing

It goes without saying that meetings should always be attended promptly. If you are running late do as much as you can to let people know what the situation is, and when you expect to arrive.
If you are responsible for organising a meeting, think about the most convenient time for your audience. Think about work days, school times and holiday periods.

9. Appearance

Think about how you present yourself when you first encounter a stakeholder, either on the telephone, at a meeting or on site. Always be polite. The first contact is very important in convincing people that you are committed to working in an open, honest way.

Body language accounts for a very large part of effective communication. Through non-verbal communication such as body language we can convey information about how we feel, what we are thinking, our respect for our audience and our social status.

10 Talking to Larger Groups of People

Public meetings are the least effective forum for dealing with high-concern, low-trust issues. If you have to attend a public meeting, you must not rely upon it as an effective communication method and will need to consider a range of supplementary and alternative communication methods.

A better approach is the ‘drop-in session’ where people can read information and talk to staff on a one-to-one basis. If you do have to hold or attend a public meeting, the advice in the accompanying box may help.

Key pointers to adopt for a public meeting

• Prepare, think about likely issues that will arise and consider how you will answer them. Plan three key messages you want to get across.

• Think carefully about when and where the meeting will be held, to make it as easy as possible for people to attend and give plenty of notice of the details.

• Ensure that visual presentations are not cluttered, cramped or overpowering.

• Supplement your presentation with other materials, such as fact sheets that can be taken away.

• Ensure that information provided is straightforward, jargon-free and concise. Graphs should be as simple as possible and explained in layman’s terms.

• Set a time limit and clear agenda.

• Keep presentations short with key messages delivered in the first part of the speech.

• Remember that the purpose of the meeting is to seek a cooperative approach not a conflict.

• Ask questions. This ensures that you gain a fuller understanding of stakeholder issues and also demonstrates that you are actively listening and interested in what people think.

• Write down all the main points raised and make sure any promised actions will be addressed.

• If possible, ensure there is an effective, preferably independent chairperson to run the meeting.
9. Conclusions

Effective risk communication is based on anticipating possible reactions, understanding the audience and conveying clear information that addresses people's concerns and allows you to establish your organisation as responsible and trustworthy.

Plan communication activities well and pre-test materials whenever possible so that they are effective with the target audience. Ensure that company representatives have been trained in effective presentation and communication skills. Build in an evaluation process so that future efforts will be more effective.

When communicating, focus on the issue of concern and help people to understand the complete picture, while recognising that people want straightforward answers. In order to build trust, be open about the limits of scientific research but convey what is known. Watch for unintended consequences of your communication activities.

Even if you communicate well, there will be times when a mutually acceptable agreement is not possible. However, your actions can ensure that your own reputation and that of your organisation remain intact and future proposals may be easier.

If applied carefully and consistently, the techniques presented in this guide should assist you to address concerns and deliver network deployments with less community opposition and delay.

Appendix 1: The IARC Classification of RF-EMF

One of the more difficult issues to explain is the International Agency for Research on Cancer (IARC) classification of radio frequency electromagnetic fields (RF-EMF), including mobile phones, as a possible human carcinogen (IARC group 2B).

**The IARC Classification Process**

IARC is an agency of the World Health Organization (WHO). IARC looks at a wide range of different “agents” – that is substances or activities that include chemicals, complex mixtures, processes, occupational or environmental exposures, cultural or behavioural practices, biological organisms, and physical substances. Being a scientific organisation, IARC uses a classification system based on the strength of the available scientific evidence for any association with cancer. Further details are available on the IARC Monographs website: http://monographs.iarc.fr/index.php

IARC establishes independent Working Groups of scientists to review the scientific evidence in relation to particular agents and the Working Group meets to consider the evidence as a whole. They aim to achieve consensus among Working Group members regarding the strength of the evidence and how to classify the agent(s) under consideration.

Of course the science is not always clear. There will be good studies and there will be contradictory studies. There are also very different types of research studies to consider. The Working Group will consider:

- **Exposure data** – how humans are exposed to the substance or process under review.
- Studies of cancer in humans – these may be *population studies or experimental studies.*
- Studies of cancer in experimental animals – usually from *laboratory animal tests.*
- **Mechanistic studies** and other data – are there known physical processes (mechanisms) at work that can explain any association?

For each type of study the Working Group examines
the strength of the evidence and also the extent to which one type research evidence supports another. For each type of evidence they assess whether the strength of evidence is sufficient, limited or inadequate. They also look at consistency of evidence, for example, are associations reported in population studies supported by the controlled animal laboratory studies.

Finally, the body of evidence is considered as a whole in order to reach an overall evaluation of the extent to which an agent may or may not cause cancer in humans.

The IARC Classifications
Since 1971, IARC has evaluated more than 900 agents. This includes alcohol, asbestos, benzene, formaldehyde, drinking coffee, hair colouring products, powerline frequencies, shiftwork that involves circadian disruption, and paracetamol.

For each agent reviewed, IARC uses five categories to classify the strength of the scientific evidence that exposure to the agent may be a cancer hazard (not the size of the potential risk).

The IARC classification of Radio Frequency fields (RF)
On 31st May 2011 following a Working Group meeting, radiofrequency electromagnetic fields were classified as possibly carcinogenic to humans (Group 2B), based on limited evidence of an increased risk for two types of brain cancer, associated with long term wireless phone use. The evidence was judged as inadequate for other types of cancers, occupational and environmental exposures.

IARC state in their summary of results:

“The evidence was reviewed critically, and overall evaluated as being limited among users of wireless telephones for glioma and acoustic neuroma, and inadequate to draw conclusions for other types of cancers. The evidence from the occupational and environmental exposures mentioned above was similarly judged inadequate” (emphasis added)

Clearly, it is important to put this into perspective and the best way is to refer to the explanation given by the WHO:

“There are some indications of an increased risk of glioma for those who reported the highest 10% of cumulative hours of cell phone use, although there was no consistent trend of increasing risk with greater duration of use. The researchers concluded that biases and errors limit the strength of these conclusions and prevent a causal interpretation.

Based largely on these data, IARC has classified radiofrequency electromagnetic fields as possibly carcinogenic to humans (Group 2B), a category used when a causal association is considered credible, but when chance, bias or confounding cannot be ruled out with reasonable confidence.”

In comments on the classification many health authorities have stated that the IARC classification is an indication that further research is needed. They have also pointed out that individuals can take steps to reduce their personal exposure from use of mobile phones.

Importantly, the WHO continues to recommend adoption of the international RF-EMF exposure limits.

### Appendix 2: Risk Communication Approaches

**Notification (One-Way Communication)**

<table>
<thead>
<tr>
<th>Target Audience</th>
<th>Approach</th>
<th>Objectives</th>
<th>Summary of Process</th>
<th>Good points</th>
<th>Bad Points</th>
</tr>
</thead>
<tbody>
<tr>
<td>Concerned Communities</td>
<td>Community affairs contact</td>
<td>Contact point and escalation coordination</td>
<td>Have a single point of contact for all communications with concerned community members</td>
<td>Provides consistent and reliable exchange of information</td>
<td>Requires dedicated community affairs specialist who will have to field the majority of concerns – this can be very demanding</td>
</tr>
<tr>
<td>General Public</td>
<td>Corporate website or external dedicated website by operators</td>
<td>Provide further information</td>
<td>Have a single source of information on the web to support consistent messaging and information provision</td>
<td>Information should be consistent and can be amended to make new information available quickly</td>
<td>Not all citizens have access to the internet and this may disadvantage some people; the information needs to be kept up-to-date and checked for accuracy, consistency and readability; the information may not be trusted</td>
</tr>
<tr>
<td>The Media</td>
<td>Public Relations</td>
<td>To raise awareness and improve interest in the issues. To stimulate interest in participation</td>
<td>Use of all media channels to issue information and promote the concepts under consideration. Production of written and display materials</td>
<td>Reaches a wide range of stakeholders and general public</td>
<td>Requires dedicated communications team; Some element of message control can be lost</td>
</tr>
<tr>
<td>Local Community The Media</td>
<td>Newsletters</td>
<td>To notify and stimulate interest within an entire community. To ensure that employees are aware of options/proposals under consideration</td>
<td>Delivers information about the proposed development and seeks stakeholder views from the entire community, either through an existing newsletter, or through a specifically developed publication</td>
<td>Allows message to be controlled. Reaches all households in the selected community. Encourages staff to be transparent in decision making. Demonstrates that staff views are as important as other stakeholder views</td>
<td>Does not guarantee that information will be read. Poor literacy level may act as a barrier to accessing information</td>
</tr>
<tr>
<td>Neighbours</td>
<td>Notify immediate/directly affected community</td>
<td>To notify those people likely to be affected by any decisions made</td>
<td>Direct correspondence sent to local stakeholders, with information on options/proposal and how to participate in decision making process</td>
<td>Ensures people most likely to be affected by decisions receive appropriate information</td>
<td>Information may not be read</td>
</tr>
<tr>
<td>Local Community Local Community Leaders</td>
<td>Public Meeting</td>
<td>To make information accessible to local stakeholders and public, and enable discussion of issues</td>
<td>Provides an opportunity for a large group of potentially affected individuals to find out about plans and to question and comment on them directly</td>
<td>Can provide information to a wide group of people, and enables interactive dialogue. Questioning can improve understanding of the issues from all stakeholder perspectives. Can help build trust and credibility</td>
<td>Generally difficult to predict outcome and can easily degenerate into confrontation</td>
</tr>
</tbody>
</table>
## Consultation (Two-Way Communication)

<table>
<thead>
<tr>
<th>Target Audience</th>
<th>Approach</th>
<th>Objectives</th>
<th>Summary of Process</th>
<th>Good points</th>
<th>Bad Points</th>
</tr>
</thead>
<tbody>
<tr>
<td>Immediate Neighbours</td>
<td>Door knock</td>
<td>To directly engage on an individual level with public stakeholders</td>
<td>Targeted information delivery direct to key stakeholders at each household in a community</td>
<td>Controls the message. Takes information direct to key stakeholders</td>
<td>Requires trained staff to undertake activity. Time and labour intensive</td>
</tr>
<tr>
<td>Neighbours Local Community Leaders The Media</td>
<td>Information Road Show</td>
<td>To take information direct to general stakeholders</td>
<td>Travelling, staffed display with information on the concepts under consideration</td>
<td>Supports social learning. Allows information to be provided and clarified to a general audience. Permits some qualitative feedback</td>
<td>Limited target audience.</td>
</tr>
<tr>
<td>Regulators and Local Officials</td>
<td>Consult early with regulators and local officials</td>
<td>Provides decision makers with information and enables significant issues to be addressed early on in the process</td>
<td>Direct correspondence or verbal communication with key relevant council officers, with information on options/proposal and plans for decision making process</td>
<td>Can help to foster a positive relationship with the officials. Demonstrates transparency in decision making</td>
<td>Officials may sometimes be too busy to participate in pre-application consultation</td>
</tr>
<tr>
<td>Local Politicians</td>
<td>Consult with local politicians early</td>
<td>Enables detailed and controlled information to be read by key local decision makers and policy formers</td>
<td>Direct correspondence or verbal communication with key relevant council members, with information on options/proposal and plans for decision making process</td>
<td>Local politicians will have strategic local knowledge which they will use in providing their official response to proposals. Detailed and controlled information can be provided direct to a key target audience. It can establish credibility with key local decision makers for being open and “up front” with information</td>
<td>There may be a conflict of allegiance for councillors, for example, between community values and political stances. Sometimes councillors will not comment on a proposal until an official planning application has been submitted. A lack of response may not be indicative of a lack of interest in the issue and this could be misleading in assessing feedback. Letters may not be read. The issue may be used politically during election periods</td>
</tr>
<tr>
<td>Local Politicians Regulators and Local Officials</td>
<td>Presentations to local decision makers</td>
<td>To involve local policy and decision makers</td>
<td>Tailored briefing sessions to a group of invited, relevant Councillors</td>
<td>Targets selected stakeholder representatives. Provides an opportunity for mutual understanding of needs and concerns. Enables discussion around a range of issues. Lends itself to sharing understanding rather than confrontation</td>
<td>There is a risk that the wider public may not always support the output of such closed-invite discussions. This can be time and labour intensive. It may be viewed as lobbying</td>
</tr>
<tr>
<td>Local Community Leaders</td>
<td>Consult with community representatives</td>
<td>To use existing community contacts to cascade information to stakeholders</td>
<td>Information about the proposal can be sent directly to people representing the wider community. Face to face meetings with community representatives can begin the cascade of information into a community</td>
<td>Opportunity exists to reach a wide range of people living in, working in, visiting, or using the resources of the area, through trusted networks</td>
<td>May not reach the socially isolated members of community. Message may be modified to suit local community agendas</td>
</tr>
<tr>
<td>Local Community Leaders Neighbours and ‘hard-to-reach’ groups</td>
<td>Notify representatives of sensitive activities</td>
<td>To involve hard to reach stakeholders and consider specific view points</td>
<td>Information about the proposal can be sent directly to people representing the stakeholder views of special interest groups</td>
<td>Can help to involve ‘hard-to-reach’ groups; Helps to ensure that special interests are considered</td>
<td>Not representative of wider public view points</td>
</tr>
<tr>
<td>Politicians Regulators and Public Officials</td>
<td>Consult with politicians</td>
<td>To involve policy makers and strategic viewpoints.</td>
<td>Providing information about the proposal to local politicians and gaining feedback from a strategic figurehead on behalf of the range of communities with an area</td>
<td>Politicians can act as credible sources of information, and therefore providing information to communities through the local politician might help you to engage stakeholders</td>
<td>Politicians might adopt strong stances during election periods, that will influence stakeholder perceptions, if they consider that this will be helpful in their own canvassing</td>
</tr>
<tr>
<td>Target Audience</td>
<td>Approach</td>
<td>Objectives</td>
<td>Summary of Process</td>
<td>Good points</td>
<td>Bad Points</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------</td>
<td>----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Local Community</td>
<td>Open House Meetings</td>
<td>To make information accessible to local stakeholders and public, and to enable discussion of the issues</td>
<td>Replaces the public meeting as the main way of creating a local presence and dialogue with residents and others. Taking the form of an informative drop-in session, the loosely structured format allows interested parties to find out about issues at their own pace</td>
<td>Avoids the stress and heat of a public meeting by allowing interested parties to find out about issues at their own pace. Can be arranged at the invitation of a local group. Fosters small group and one-on-one discussions. Avoids confrontation and builds credibility.</td>
<td>May attract a limited audience. - Potentially difficult to document public input, due to the loose structure. Staff intensive. It has the potential to be hijacked by local activist groups.</td>
</tr>
<tr>
<td>Local Community Leaders</td>
<td>Community Event Presence</td>
<td>To raise awareness among wider stakeholders</td>
<td>Having a presence / staffed display at pre-established community events, such as summer fairs or country shows, providing general information and answering questions about proposals</td>
<td>Accessible and user friendly approach</td>
<td>Unlikely to reach entire local community. Timetable restrictions according to local events programme.</td>
</tr>
<tr>
<td>Regulators NGOs/Pressure Groups Community Leaders</td>
<td>National Stakeholder Forum roundtable workshops</td>
<td>To include interested parties with wide ranging perspectives, and involve them in considering policy and options</td>
<td>National stakeholder groups invited to nominate representatives to join forum. Approximately 25 members can be accommodated</td>
<td>National perspective. Allows expert review of other stakeholder input as well as special interest contribution. Supports learning</td>
<td>Stakeholder analysis required to ensure representativeness and inclusiveness in membership. May require payment to members. Requires facilitation. Members may not remain involved for the entire process.</td>
</tr>
<tr>
<td>Individual members of the public</td>
<td>Telephone hotline</td>
<td>To provide access to information and feedback</td>
<td>People can be referred to the information hotline for further details or to lodge comments on proposals</td>
<td>Provides a flexible feedback option, suiting peoples other commitments. Overcomes potential issues with literacy barriers</td>
<td>Requires trained staff and professional management</td>
</tr>
<tr>
<td>The wider public and informed individuals</td>
<td>Web-based Consultation</td>
<td>To notify and gain feedback from wider stakeholder interests</td>
<td>Dedicated website with facility to accommodate feedback</td>
<td>Accommodates individuals' availability for participation. Can provide easy access to documents for those seeking extra detail. Participants can be invited via email or may seek to become involved directly. Can reach large numbers of people easily and at relatively low cost.</td>
<td>Not all sectors of population have internet access. Requires rapid, good quality response to stakeholder input. Only those with an interest are likely to participate, rather than providing a representative sample of the population.</td>
</tr>
</tbody>
</table>
Appendix 3: Additional Guidance for Developing Countries

For developing countries where the standards may not be formalized, where local permitting processes are uncertain, and yet the pressures for deployment are great, best practice risk communication suggests:

1. **Make it clear that phones and base stations comply with international limits**

2. **Minimise the local impacts, especially visual impact**

3. **Address the myths and misunderstandings.**

**Communicate compliance with exposure limits**
Public confidence needs to be established through compliance with the regulatory standards and making information available to confirm that phones and base station sites comply with health and safety guidelines.

In some countries, the RF exposure standard may not be specified. In addition, the antenna sitting requirements may be unclear and may change from one administrative area to another. Under these circumstances it is important to provide documentation and reassurances to confirm that all reasonable steps have been taken to meet the current international standards and good practices. It is essential from a risk communication perspective to make clear that there is “nothing to hide” – that rolling out mobile communication networks is a well-understood process and uses established technology.

**Minimise the local impacts, especially visual impact**
Locating base stations within communities, while essential to efficient network operation, can increase anxiety due to their proximity to people and where they live. If it is feasible, steps to improve the appearance and to minimize the visual impact of base station antenna deployment on local communities will reduce public concern. In developing countries, the local infrastructure can seem untidy and less well organized than in other countries. Under these circumstances it is important not to make things worse visually. A general guide is to design consistent with similar structures in the surrounding area. However, rigid policy solutions are unlikely to be effective as base stations often change with time as new mobile network operators join the market, as different parts of the radio spectrum becomes commercially available, and as the technology evolves.

**Address the myths and misunderstandings**
Experience shows that common myths and misunderstandings about mobile phones and base stations can be quickly established and difficult to dispel. Early communication about radio signals with potentially concerned stakeholders is preferable to late or no communication. All the experience and evidence confirms that communicating with people too late in the process merely causes distrust and anxiety. Early communication allows time to better explain the process and find agreed solutions.

Common myths that surround mobile phones and antenna sites tend to arise because of some of the risk perception factors that were described in Chapters 2, 3 and 4. Some of those perception factors are “cognitive” – which means that they are influenced by facts and information (how much power does an antenna site transmit in comparison to other sources of radio signals?). Other perception factors are “affective” – which means that they are influenced more by emotion (will I get a brain tumour if I have been using my mobile phone such a lot at work?). People’s overall perceptions of risk from mobile phones and from antenna sites will involve both types of influence to a greater or lesser extent.

Myths and misunderstandings are difficult to dispel because they often emphasize the emotional factors such as fear (of cancer or infertility) and lack of trust (in mobile phone companies and governments). One approach is to “debunk” the myths – that is to try to dispel them by calling them “irrational”. However, while it may seem attractive to “put the record straight” in this way, this type of approach is likely to fail because it creates a barrier between those who refer to the myth and those who ridicule them for doing so. If people believe that you think they are behaving irrationally – they will not listen to you or read your information.

The best way to deal with myths and misunderstandings takes time and patience.

Greatest success is achieved by working with trusted local stakeholders to explain why the myths and misunderstandings are both inaccurate and unhelpful. Use trusted third parties – a local doctor, schoolteacher, or religious leader as a “bridge” into a
local community. Provide them with support – visual information, explanations and the confidence to help others better understand the issues. Dispelling the myths and misunderstandings is important – but it is best achieved as part of a planned and targeted approach to working with local stakeholders.

Two observations emerge from this. First, that it is not just in the developing countries that myths and misunderstandings occur because it is risk perception that predisposes people to listen to and repeat them.

Secondly, that it is essential to remember certain key aspects of risk communication guidance when trying to dispel these misunderstandings, namely:

• People will not accept information from people they do not trust – especially if they feel they are being “talked down to” or “made fun of”.

• A more effective way is to build bridges with trusted third parties who can then help to dispel the myths and misunderstandings.

• Keep the language simple, avoid using technical jargon, and use diagrams where possible to make things clear.
