

Open Gateway Community Webinar #3

Exploring Innovation in the Digital Landscape

9th November 2023

GSMA™ Open Gateway Product Stream

GSMA Antitrust Policy

All GSMA participants **must** abide by the following rules:

DO clearly identify the positive purpose of each project and follow it

DO consult with legal in areas where you are unsure

DON'T enter into agreements that restrict other parties' actions or creates barriers to market entry

DON'T discuss or exchange information on pricing, business plans, or any other confidential or commercially sensitive data

DON'T discuss or recommend any reference prices, or any particular pricing policy

Agenda

Welcome

Open Gateway API Certification & Compliance

- GSMA - Mark Cornall

Open Gateway Challenge

- GSMA – Lucy Thatcher

Reflections from MWC Kigali & Las Vegas

- Nokia – Mikko Jarva
- Chenosis – Waseem Amra

Open Gateway Update From Market Champions

- Telecom Argentina – Damian Sanchez
- Deutsche Telekom – Markus Kuemmerle
- Telkomsel - I Gusti N Panca

Open Gateway Certification

North Star: A developer should only need to change their credentials for global mobility

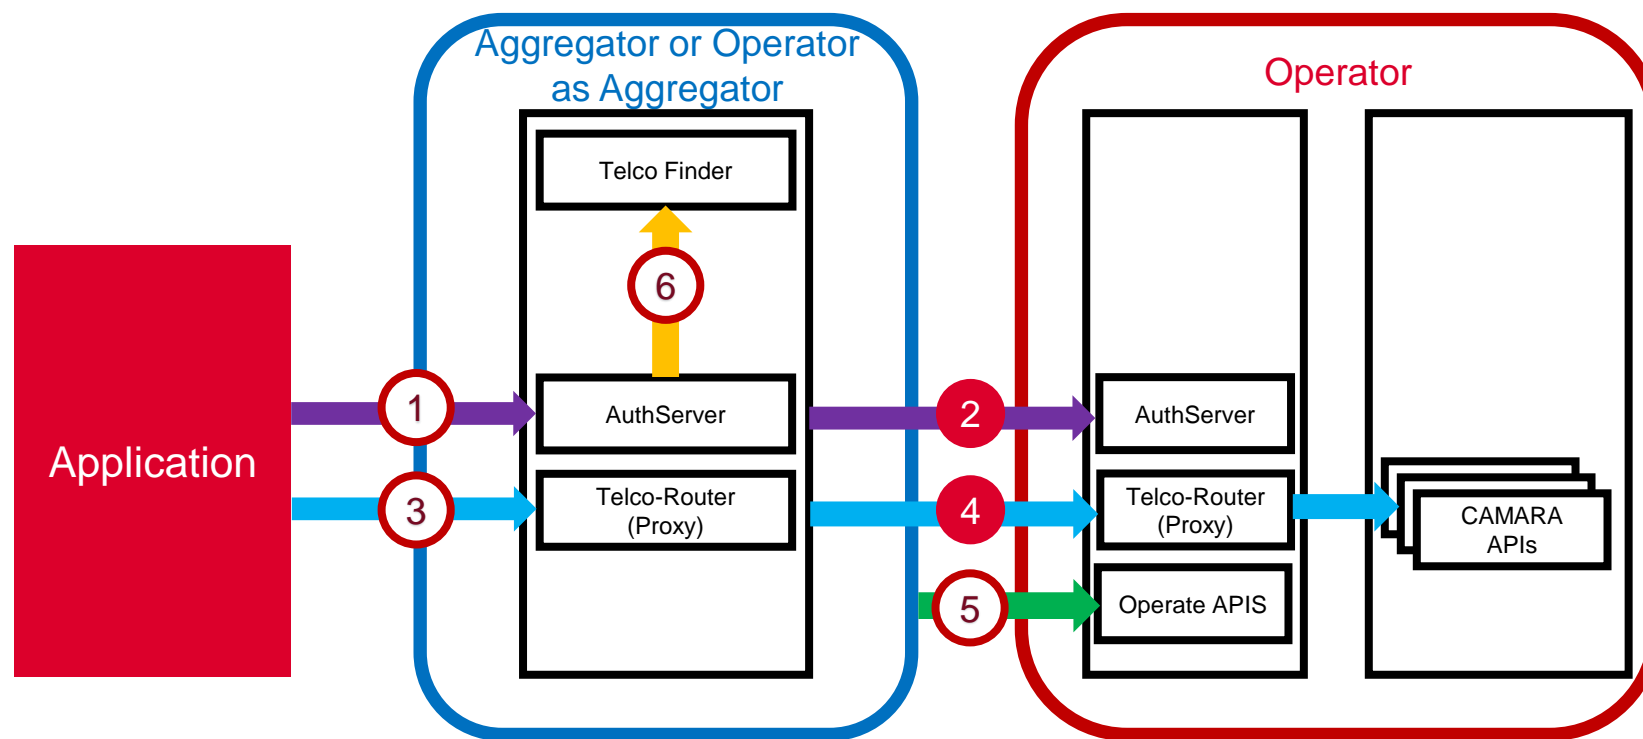

Mark Cornall

Powered by Open Gateway - Certification

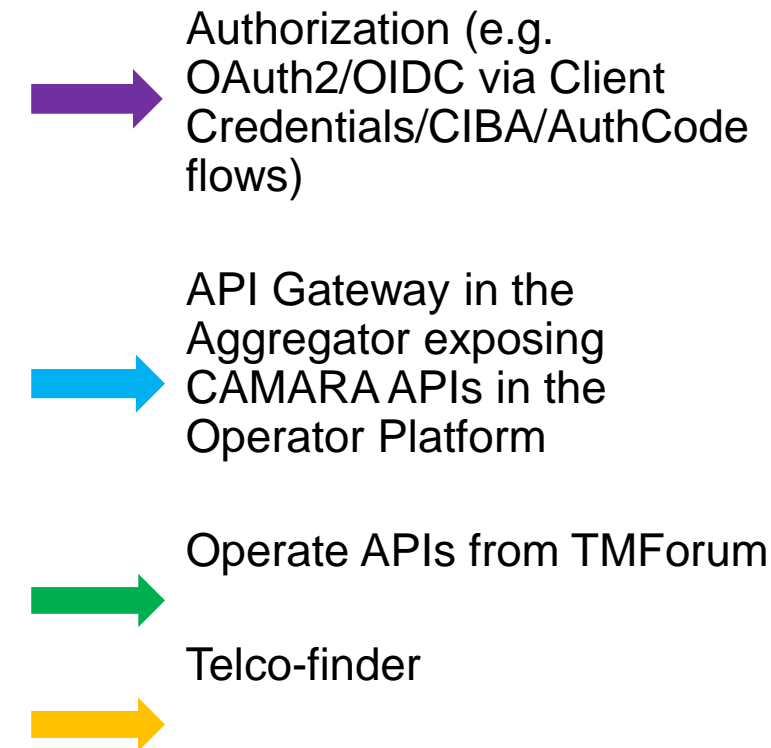

Pure adoption of CAMARA APIs
Initial flexibility on Authorisation Flows
Definitive migration to 3 leg flows for user data

Interfaces for Certification

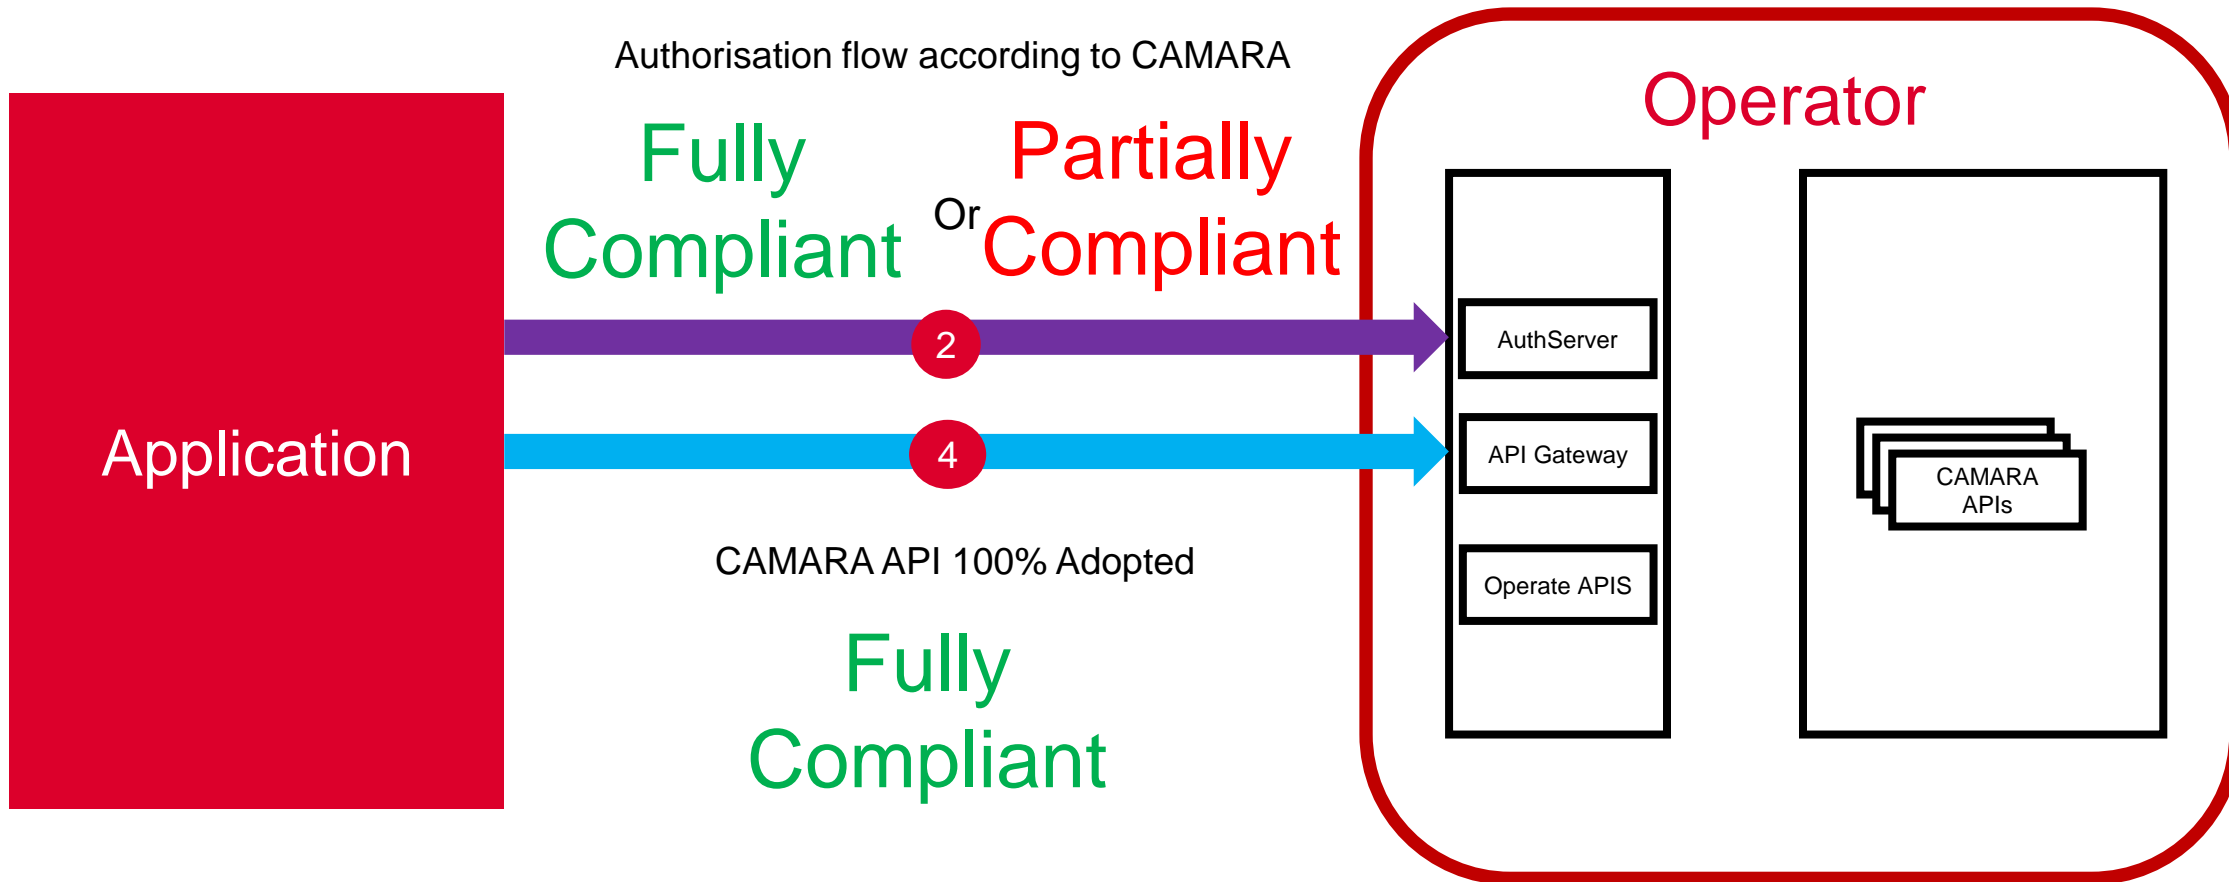

6 Standardised Interfaces in GSMA Open Gateway

Initial Focus on flows 2 and 4

Certification approach

Testing Matrix

API	Function	Fully Compliant Flow*
Device Location	Location Retrieval	CIBA
	Location Verification	CIBA
	Geofencing Subscriptions	CIBA
Carrier Billing Checkout	One Step Payment	Authorisation Code
	Two Step Payment	Authorisation Code
	Payment	Authorisation Code
	Payment Notifications	Authorisation Code
Device Status	Device Roaming Status	CIBA
	Device Status Event Subscription	CIBA
	Notification Callback	CIBA
Quality On Demand	QoS Sessions	CIBA
	QoS Profiles	ClientCredentials
Sim Swap	Retrieve Date	CIBA
	Check	CIBA
Number Verification	Phone Number Verify	Authorisation Code
	Phone Number Share	Authorisation Code
OTP Validation API	OTP Management	ClientCredentials
Device Identifier	Get Device Identifiers	ClientCredentials

Certification per API

100% Adoption of the CAMARA definition

Any Authorisation flow until Q2 2024

Partially Compliant

CAMARA Authorisation flow adopted

Fully Compliant

Global
Mobile
Awards

The GSMA Open Gateway Challenge

GSMA Open Gateway is a framework of common network APIs designed to provide universal access to operator networks for developers. It helps developers and cloud providers enhance and deploy services more quickly across operator networks via single points of access to the world's largest connectivity platform.

This prize rewards developers who use public **CAMARA APIs** to create a commercial cloud-based service which:

- Uses multiple APIs from one or many mobile operators
- Is a solution for local markets and/or international markets
- And demonstrates business value created in a specific vertical industry, e.g. FinTech (reduce fraud); Automotive (real-time telemetry)

Please note a test bed is available by contacting networks@gsma.com.

The Prize

The winning company of the **Open Gateway Challenge** will receive a range of prestigious benefits, including:

- Invitation to receive the winner's trophy on stage at the **GLOMO Awards Ceremony** during **MWC Barcelona 2024**.
- Listing on the GLOMO Awards website as a winner.
- Inclusion in a press announcement.
- Opportunity to collaborate with the team to create original content shared through relevant GSMA channels.
- Introduction to the Conference Content team responsible for programming the GSMA event series, including MWC Las Vegas, MWC Africa, MWC Shanghai, MWC Kigali, and the M360 Series.
- Mentions on MWC Barcelona's official social media channels.

The **Open Gateway Challenge** is **FREE** to enter.

DevCon Challenge (GSMA)

Application/solution ideas

September 2023

The Nokia logo is displayed in white, uppercase letters within a dark blue circular area. The background of the slide features a large, stylized graphic of two overlapping circles: a white outer ring and a dark blue inner circle, both set against a green-to-teal gradient background.

Network as Code

Available by December 2023 for
application developers in selected
networks

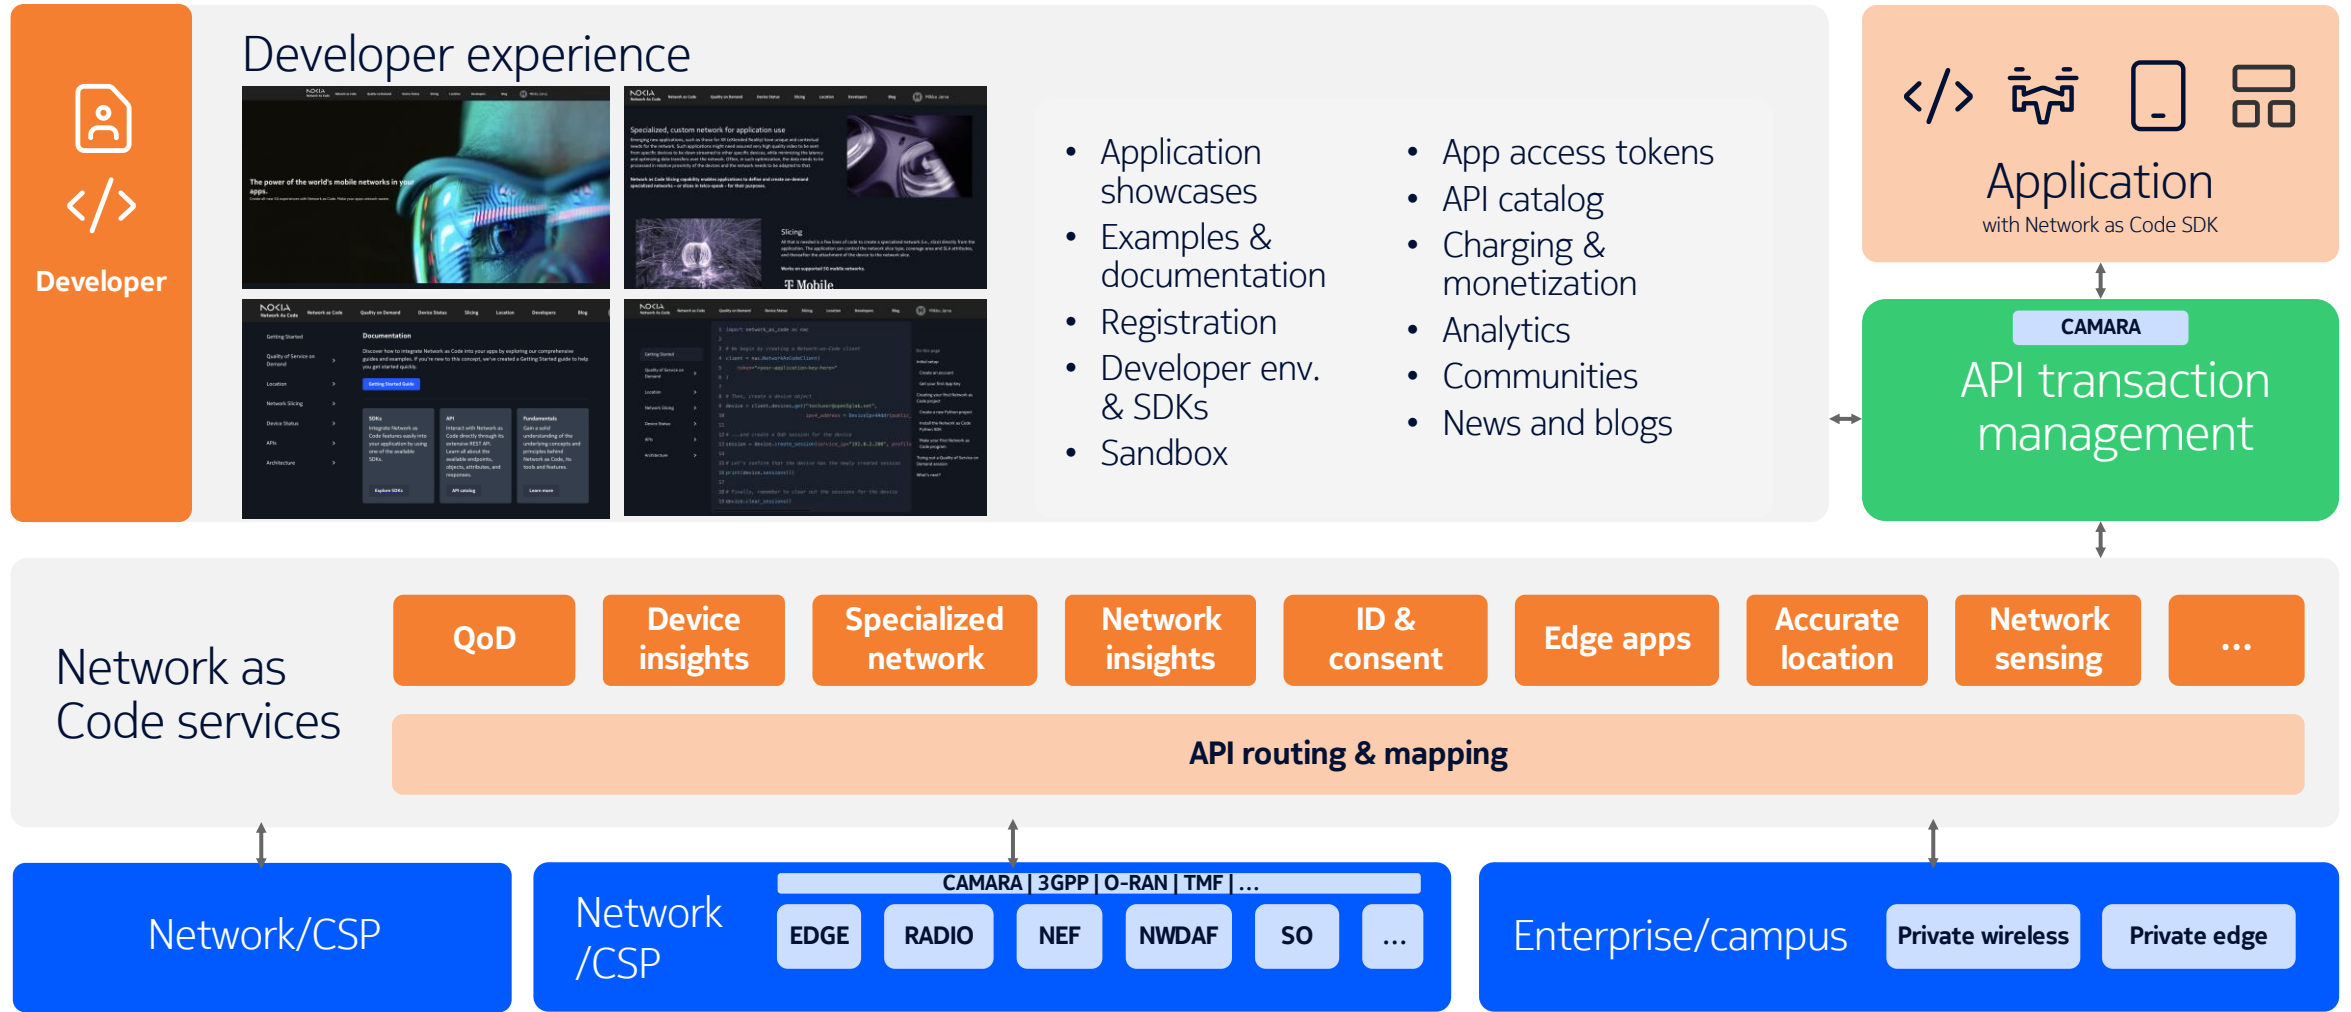

Introduction

Network as Code platform

Enterprises (B2B & B2C)

Powerful network capabilities

The screenshot displays the Nokia Network As Code website interface. At the top, the Nokia logo and 'Network As Code' tagline are on the left, with navigation links for 'Products', 'Documentation', and 'Blog' in the center, and a 'Log in' button on the right. Below the navigation, there are two main sections: 'Devices' and 'Networks'. The 'Devices' section includes three items: 'Quality of Service on Demand' (Dynamically optimize mobile network connections), 'Device Location' (Notifications for device connection events), and 'Device Status' (Approximate location information). The 'Networks' section includes 'Specialized Networks' (Create private networks for special use-cases). The main content area features a heading 'Specialized, custom network for application use' followed by a paragraph explaining the need for specialized networks for XR applications. Below this is a sub-heading 'Network as Code Slicing capability enables applications to define and create on-demand specialized networks – or slices in telco-speak - for their purposes.' To the right of this text is a close-up image of a camera lens. Further down, there is an image of a glowing network slice, followed by the heading 'Slicing' and a paragraph explaining that a few lines of code can create a specialized network slice. Below this is the text 'Works on supported 5G mobile networks.' and the T-Mobile logo. A chat icon is visible in the bottom right corner of the page.

Create private networks for special use-cases

Specialized, custom network for application use

Emerging new applications, such as those for XR (eXtended Reality) have unique and contextual needs for the network. Such applications might need assured very high quality video to be sent from specific devices to be down streamed to other specific devices, while minimizing the latency and optimizing data transfers over the network. Often, in such optimization, the data needs to be processed in relative proximity of the devices and the network needs to be adapted to that.

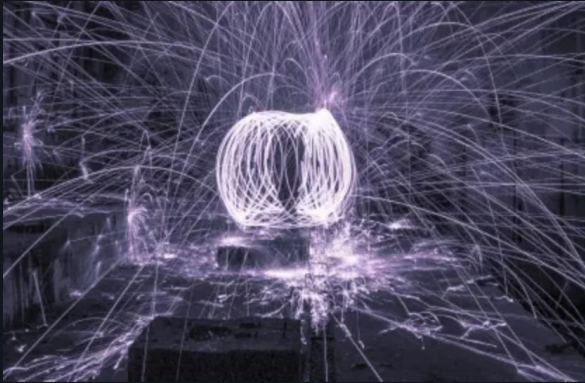

Network as Code Slicing capability enables applications to define and create on-demand specialized networks – or slices in telco-speak - for their purposes.

Slicing

All that is needed is a few lines of code to create a specialized network (i.e., slice) directly from the application. The application can control the network slice type, coverage area and SLA attributes, and thereafter the attachment of the device to the network slice.

Works on supported 5G mobile networks.

First application in minutes

The image shows a laptop screen displaying the Nokia Network As Code documentation website. The website header includes the Nokia logo, "Network As Code", and navigation links for "Products", "Documentation", and "Blog". A user profile for "Mikko Jarva" is visible in the top right. The main content area is titled "Make your first Network as Code program" and provides instructions: "Open the project directory (nac-hello-world) in your favorite code editor, such as Visual Studio Code, Emacs, or Vim and create a file called main.py." and "Copy the following code example into main.py:". A code block shows the following Python code:

```
1 import network_as_code as nac
2
3 # We begin by creating a Network as Code client
```

Below the code block, a code editor window is open, showing the same code. The editor's interface includes a search bar, a file explorer on the left, and a status bar at the bottom indicating "Ln 3, Col 14 Spaces: 4 UTF-8 LF Python 3.10.11 64-bit". A tooltip is visible over the code, showing the attributes of the `client` object, including `__annotations__`, `__builtins__`, `__cached__`, `__dict__`, `__doc__`, `__file__`, `__loader__`, `__name__`, `__package__`, and `__path__`.

On the right side of the website, a "On this page" sidebar lists various topics: "Initial setup", "Create an account", "Get your first App Key", "Creating your first Network as Code project", "Create a new Python project", "Install the Network as Code Python SDK", "Make your first Network as Code program", "Trying out a Quality of Service on Demand (QoD) session", "QoD session SDK", and "What's next?".

API Solutions

Data Sharing: Consent Framework

Due to data regulations on sharing and processing of data

Consent Approach

Explicit Consent
Consent is required when customer, known as the data subject, data is shared with a third party.

Implicit Consent
Consent is not required when legitimate interest is in the context of protecting a customer from fraud.

Processing De-Identification

Where processing and sharing of personal information is required to be localised in country, data is processed in country and then de-identified by sharing as a Boolean or indicator eg, Yes/No, 1 - 10

Data Sharing Consent Model (Explicit)

Open Gateway Local Champion Germany

Deutsche Telekom, Markus Kuemmerle

Open Gateway Local Champion Germany

Started in July 2023

Target is to have the first commercial customer on an aggregated API by MWC2024 and to present it in Open Gateway Summit event.

We decided to follow

- **A safe path**
- **An extended path**

Safe path

CAMARA version of MobileConnect APIs:

- **Sim Swap:** obtain information on any recent SIM pairing change related to the user's mobile account
- **Number Verification:** verify the phone number associated with the SIM used in the device connected to the mobile data network
- **KYC Match:** Enables Service Providers to compare the information they have on file for a particular user with that on file (and verified) by the user's Operator in their own KYC records (name, address)

Extended path

New CAMARA versions of the network APIs:

- **Quality on Demand:** set quality for a mobile connection (e.g. required latency, jitter, bit rate), get notification if network cannot fulfill
- **Location Verification:** check the location of a device
- **Device Status:** check if a device is losing connection to the network or gets reachable again, and the roaming status
- Including solution for **Consent Management**

We're learning...

Productizing an API is a much bigger nut than proving a technical service:

Legitimate
interest

Delegated
consent vs
user
consent

Naming

Decision
making

2 legged vs
3 legged
OAuth

Regulated
terms KYC

... but discussions are necessary and bring value to move the ecosystem forward!

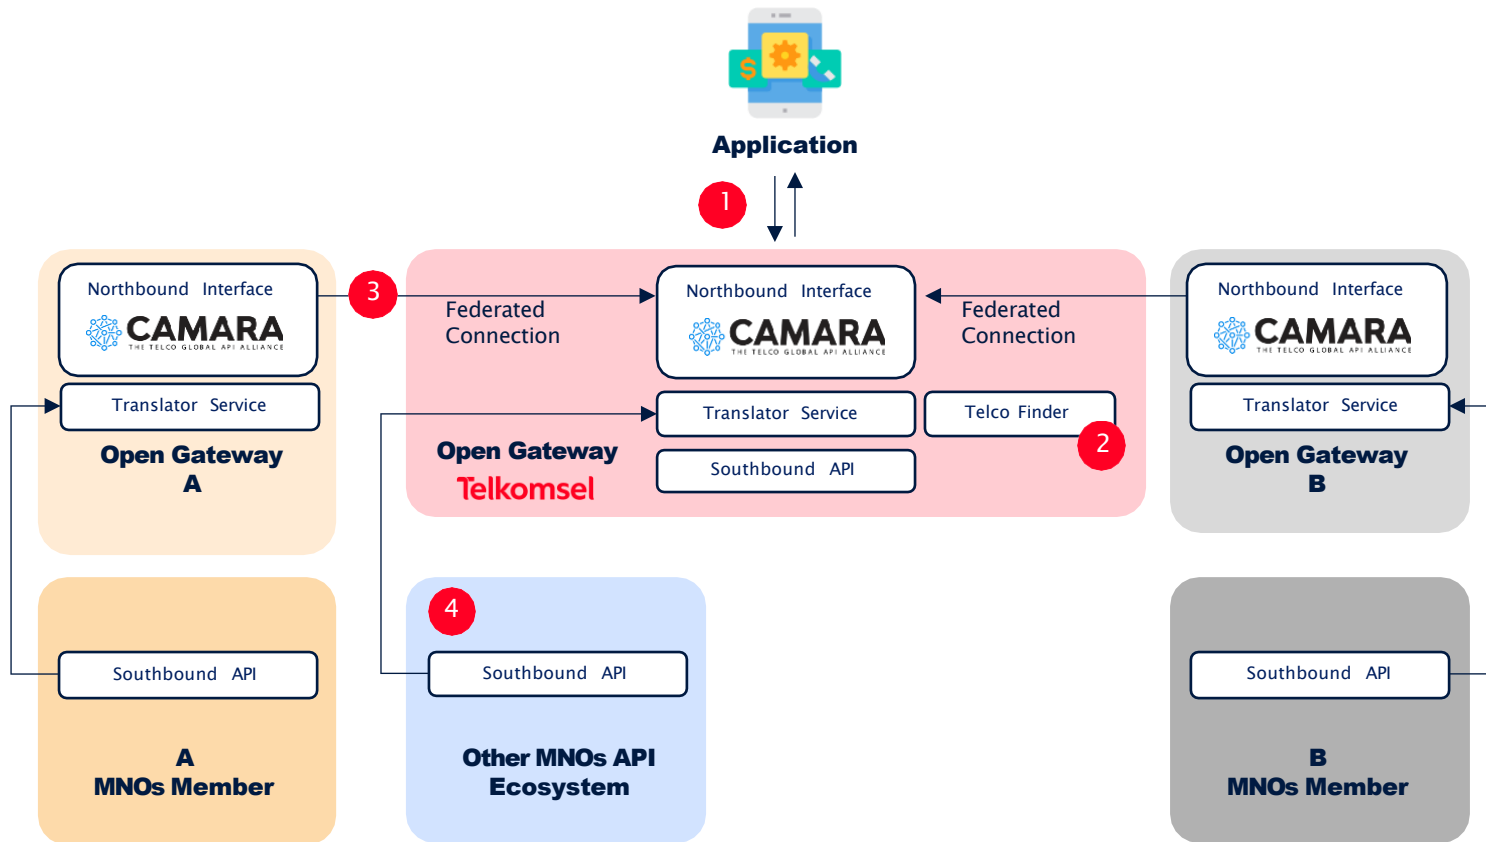

GSMA CAMARA Open API Overview

November 2023

TECHSTRA.
Beyond Technology

Telkomsel Open Gateway Initiatives

Telkomsel is currently in progress of developing an open gateway architecture that includes an aggregator and a telco finder based on GSMA Open Gateway APIs which are defined, developed and published in CAMARA

Key Highlight

- 1 **Northbound Interface as Unified Communications Node** to enable communication for federated and northbound communication using the CAMARA Specifications
- 2 **Telco Founder as a Service Router**
A service router based on what application requested to enable sending request to the designated operator
- 3 **Federated Connections between Alliances**
Enabling federated connection between alliances to enhance the resource API Capability through aggregator alliances
- 4 **Translator Services to attracts Resources API Provider**
Provide a translation service which can help to connect with Resources API Provider

Action Plan

Reconcile & Settlement Flow Process

Mechanism of API Usage between MNO, still not yet discussed how the operational flow

System Integration

Telco CAMARA API should be integrated to enable resource sharing between MNOs

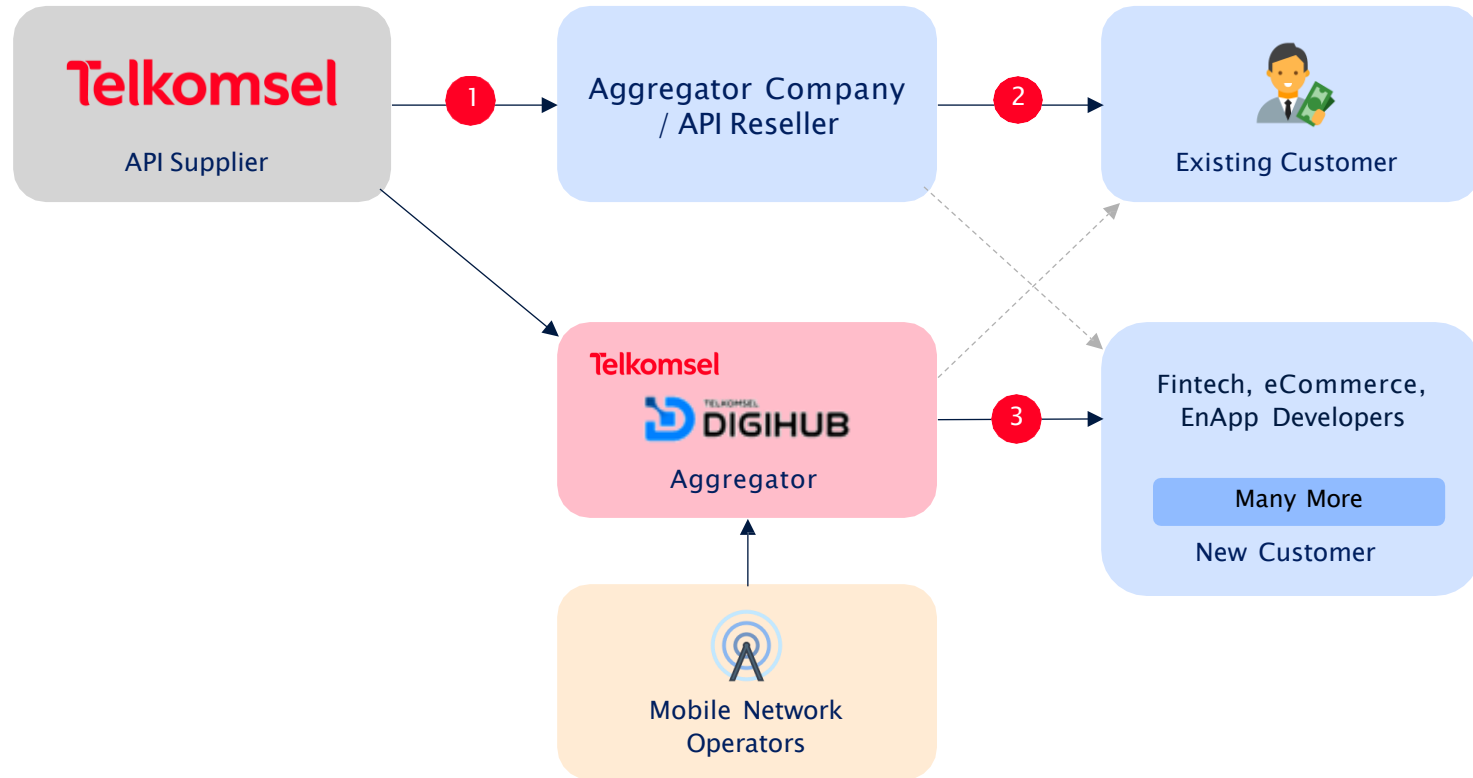

Business Integration

To enable revenue generating part of this initiatives

*All the initiatives is targeted to be done by the end of December

Telkomsel API Business Cases Scenarios

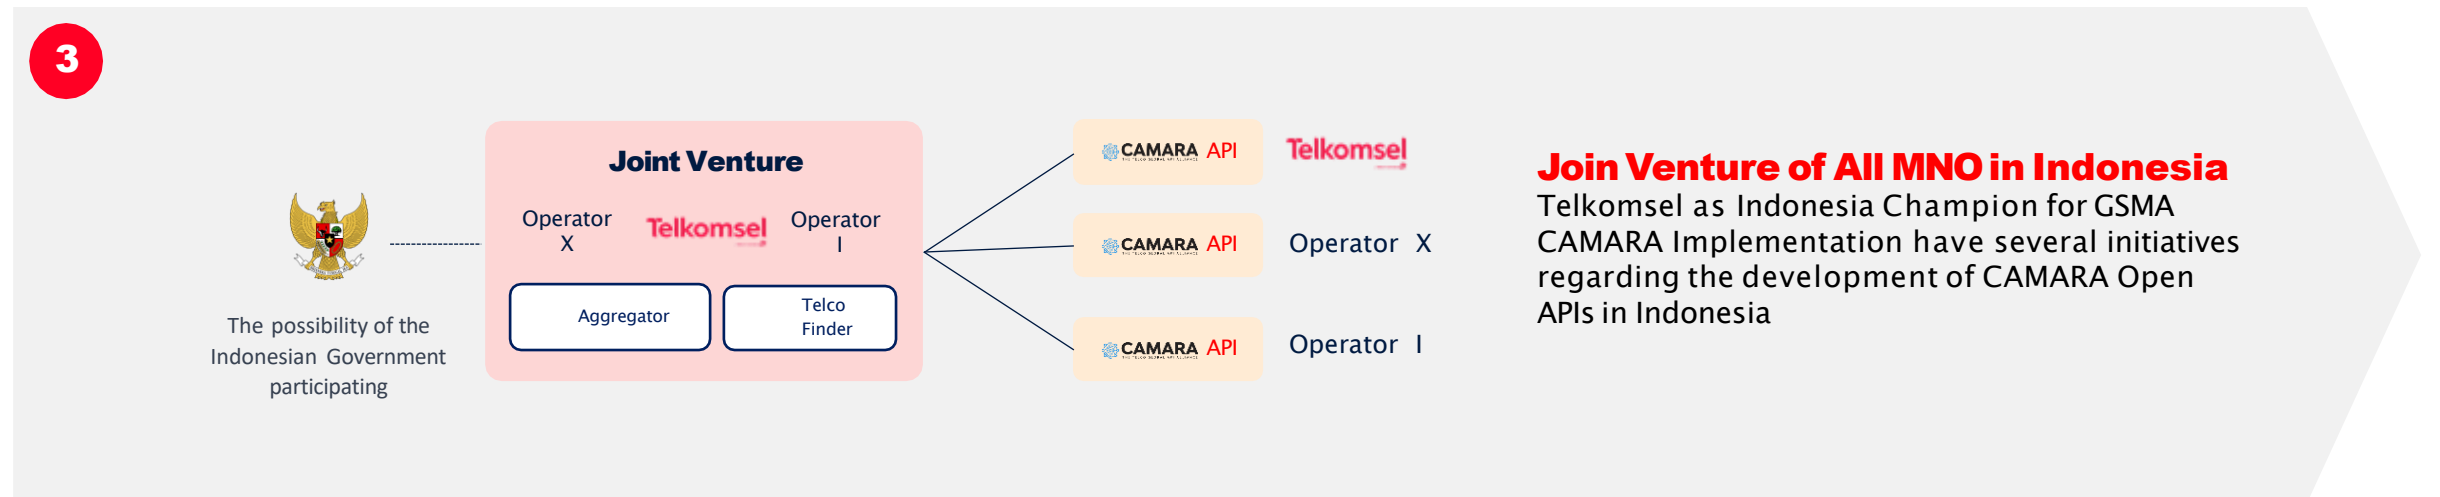

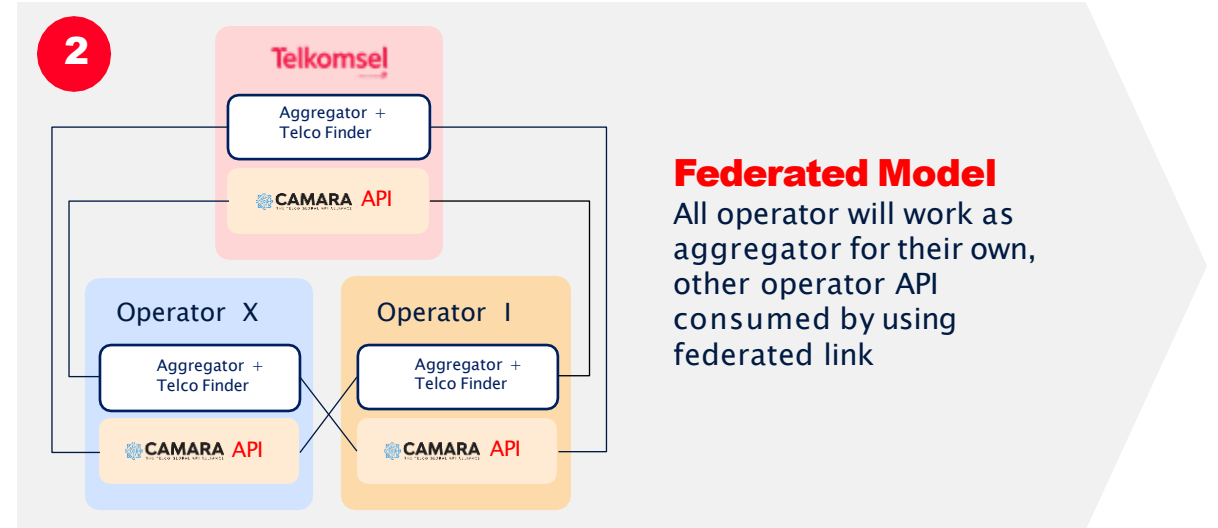

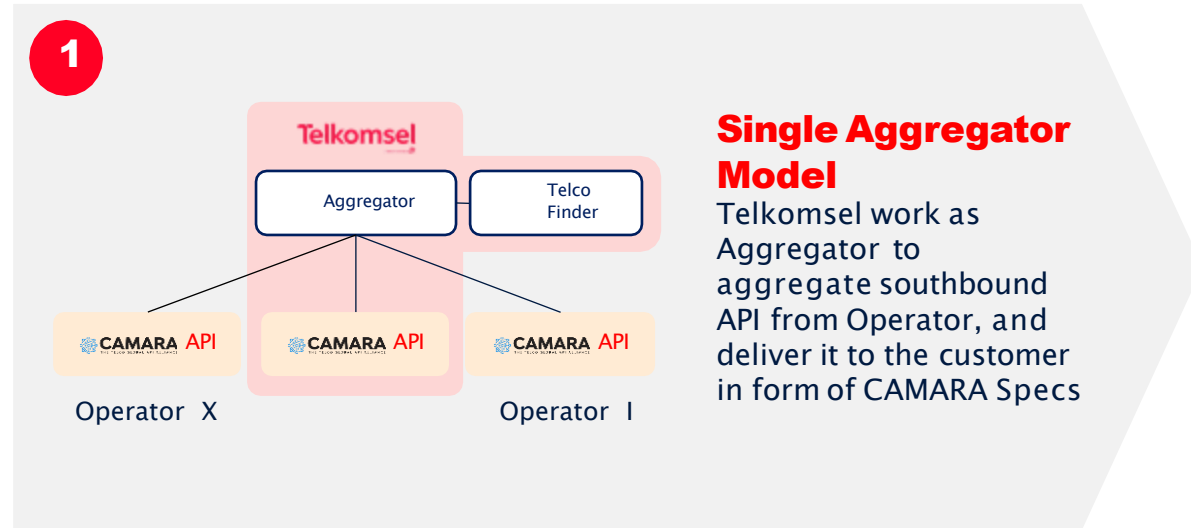

Telkomsel have several business case scenario regarding the development use case of Open API in Indonesia

Use Case	Details
1 Telkomsel partnership with Aggregator	Telkomsel supplies telco CAMARA Standards API to global aggregator to enable global business
2 Telkomsel as aggregator partner with Existing customer	Digihub as TSEL API marketplace will engage to existing customer to offer new API which will have much functionalities than the existing one
3 Telkomsel as aggregator partner with new customer	Telkomsel expanding their API Marketplace Digihub, to offer new API CAMARA to new customer to open new business stream

Business Model Scheme Potential between Operators

Several business potential between operators regarding GSMA CAMARA Open API, which can be leverage by Indonesia as new business Opportunities
