Elevating Digital Trust through Mobile Identity

Supporting EU Digital Identity

Deutsche Telekom Group, Andrzej Ochocki
MWC Mobile Identity Summit 2025

Digital Trust is a key for economic development...

Expected from end of 2026

EU member states expected to offer their citizens local ID Wallets that are recognised throughout the EU. A range of Use Cases for local and cross-border use will be available.

... and as the Telko we support our EU Member States to co-create the EU ID ecosystem.

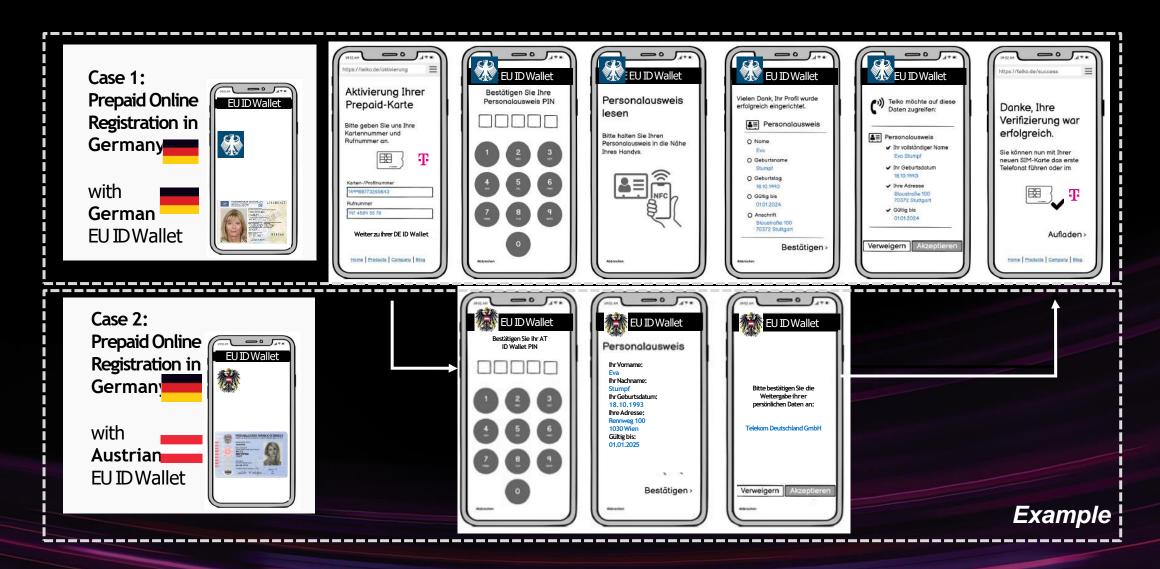

We actively participate in the EU Large Scale Pilot ...

... including the full EU cross-border usage.

But we have also other valuable assets critical for the success of eIDAS2.0...

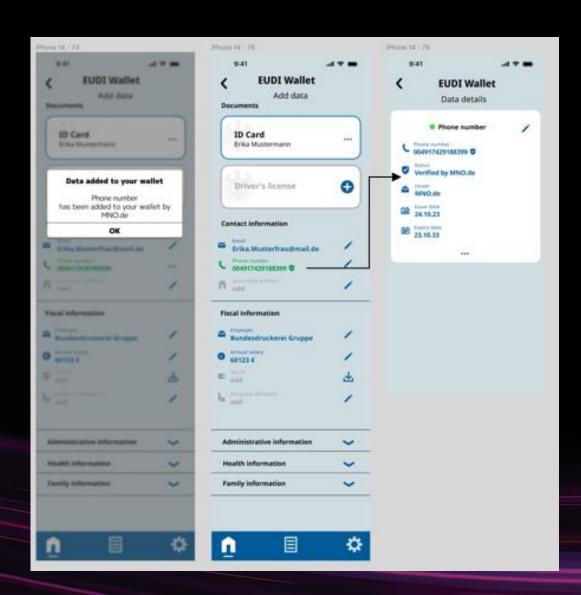

For example:

- Mobile Number (MSISDN)
- Secure SIM and ID platforms infrastructure, deployed at scale
- Being already Trusted Partner of our Customers and our States

We plan offer verified MSISDN to Relying Parties...

The Mobile Number (MSISDN):

- Issued by MNOs as Verifiable Credential
- Relevant for nearly all Relying Parties
- Fully managed lifecycles by MNOs (contract cancellation, blocking, change MNO)
- Enables real time authentication viaNumber Verify

... and also propose to use our SIM and Network assets to secure the EU ID Wallets.

- MNOs
 as
 Relying Parties
- SIM eRegistration and other processes
- Large Scale Pilots

MNOs as Issuers

- MSISDN as VC
- other Telco credentials

3 MSISDN
Authentication
w. SIM/eSIM

- Secure possession factor, works over WiFi
- Relies on network keys and access to SIM/eSIM

MNO SDK for EU ID Wallets

- at elDAS2.0 launch
- HSM approach

Phase 2

- eID in MNO profile on eSIM
- SAM

6 MNOs as eIDAS2.0 trusted ecosystem partners participating in the business model

7 MNOs as Member States partners in Marketing and Distribution

KEY ADVANTAGE OF OUR PROPOSAL:

Achieving simultaneously Security + Privacy + Reach + UX, already at launch of eIDAS2.0

Coming next....

Large Scale Pilot 2 (LSP 2), Aptitude consortium:

- Time Horizon: 2025-2027
- LSP 2 focuses on:
 - Payments and Travel Use Cases
 - Secure Customer Authentication
- Our MNO SDK proposal, using SIM-based authentication, optimally combines security, privacy, reach, and UX – all key success factors for eIDAS 2.0
